Omnisport Arena was chosen since it showcases the growing population of the region and its interest in cycling track and volleyball. Together with the unique architecture of the building it makes the arena a landmark of Apeldoorn.

The use of disposable coffee cups made for an easy and innovative way of replicating the curve of the arena. The stir sticks, which also provides stability to the model, match the exterior pattern of the arena well. Keeping sustainability in mind we only used recyclable material, also considering the budget of exchange students the model consists of materials free of charge.

Team work, process & reflection
We started the design process by going through pictures of buildings in Apeldoorn. Once we found the Omnisport, we decided that the design and the idea behind it was a good representation of the city. Then, in order to make the best use of our time, we split up into two groups to work on both the poster and the building design simultaneously. The building group began a rough design process and then started building the model. The poster group looked up information on the Omnisport and began putting together the poster. Both teams continued to keep track of what the other was doing during that time, providing advice and helpful criticism when necessary. Upon reflection, the group needed to keep better track of required sizing from the very beginning, so that the size limitations would be met.
