

# CERVI

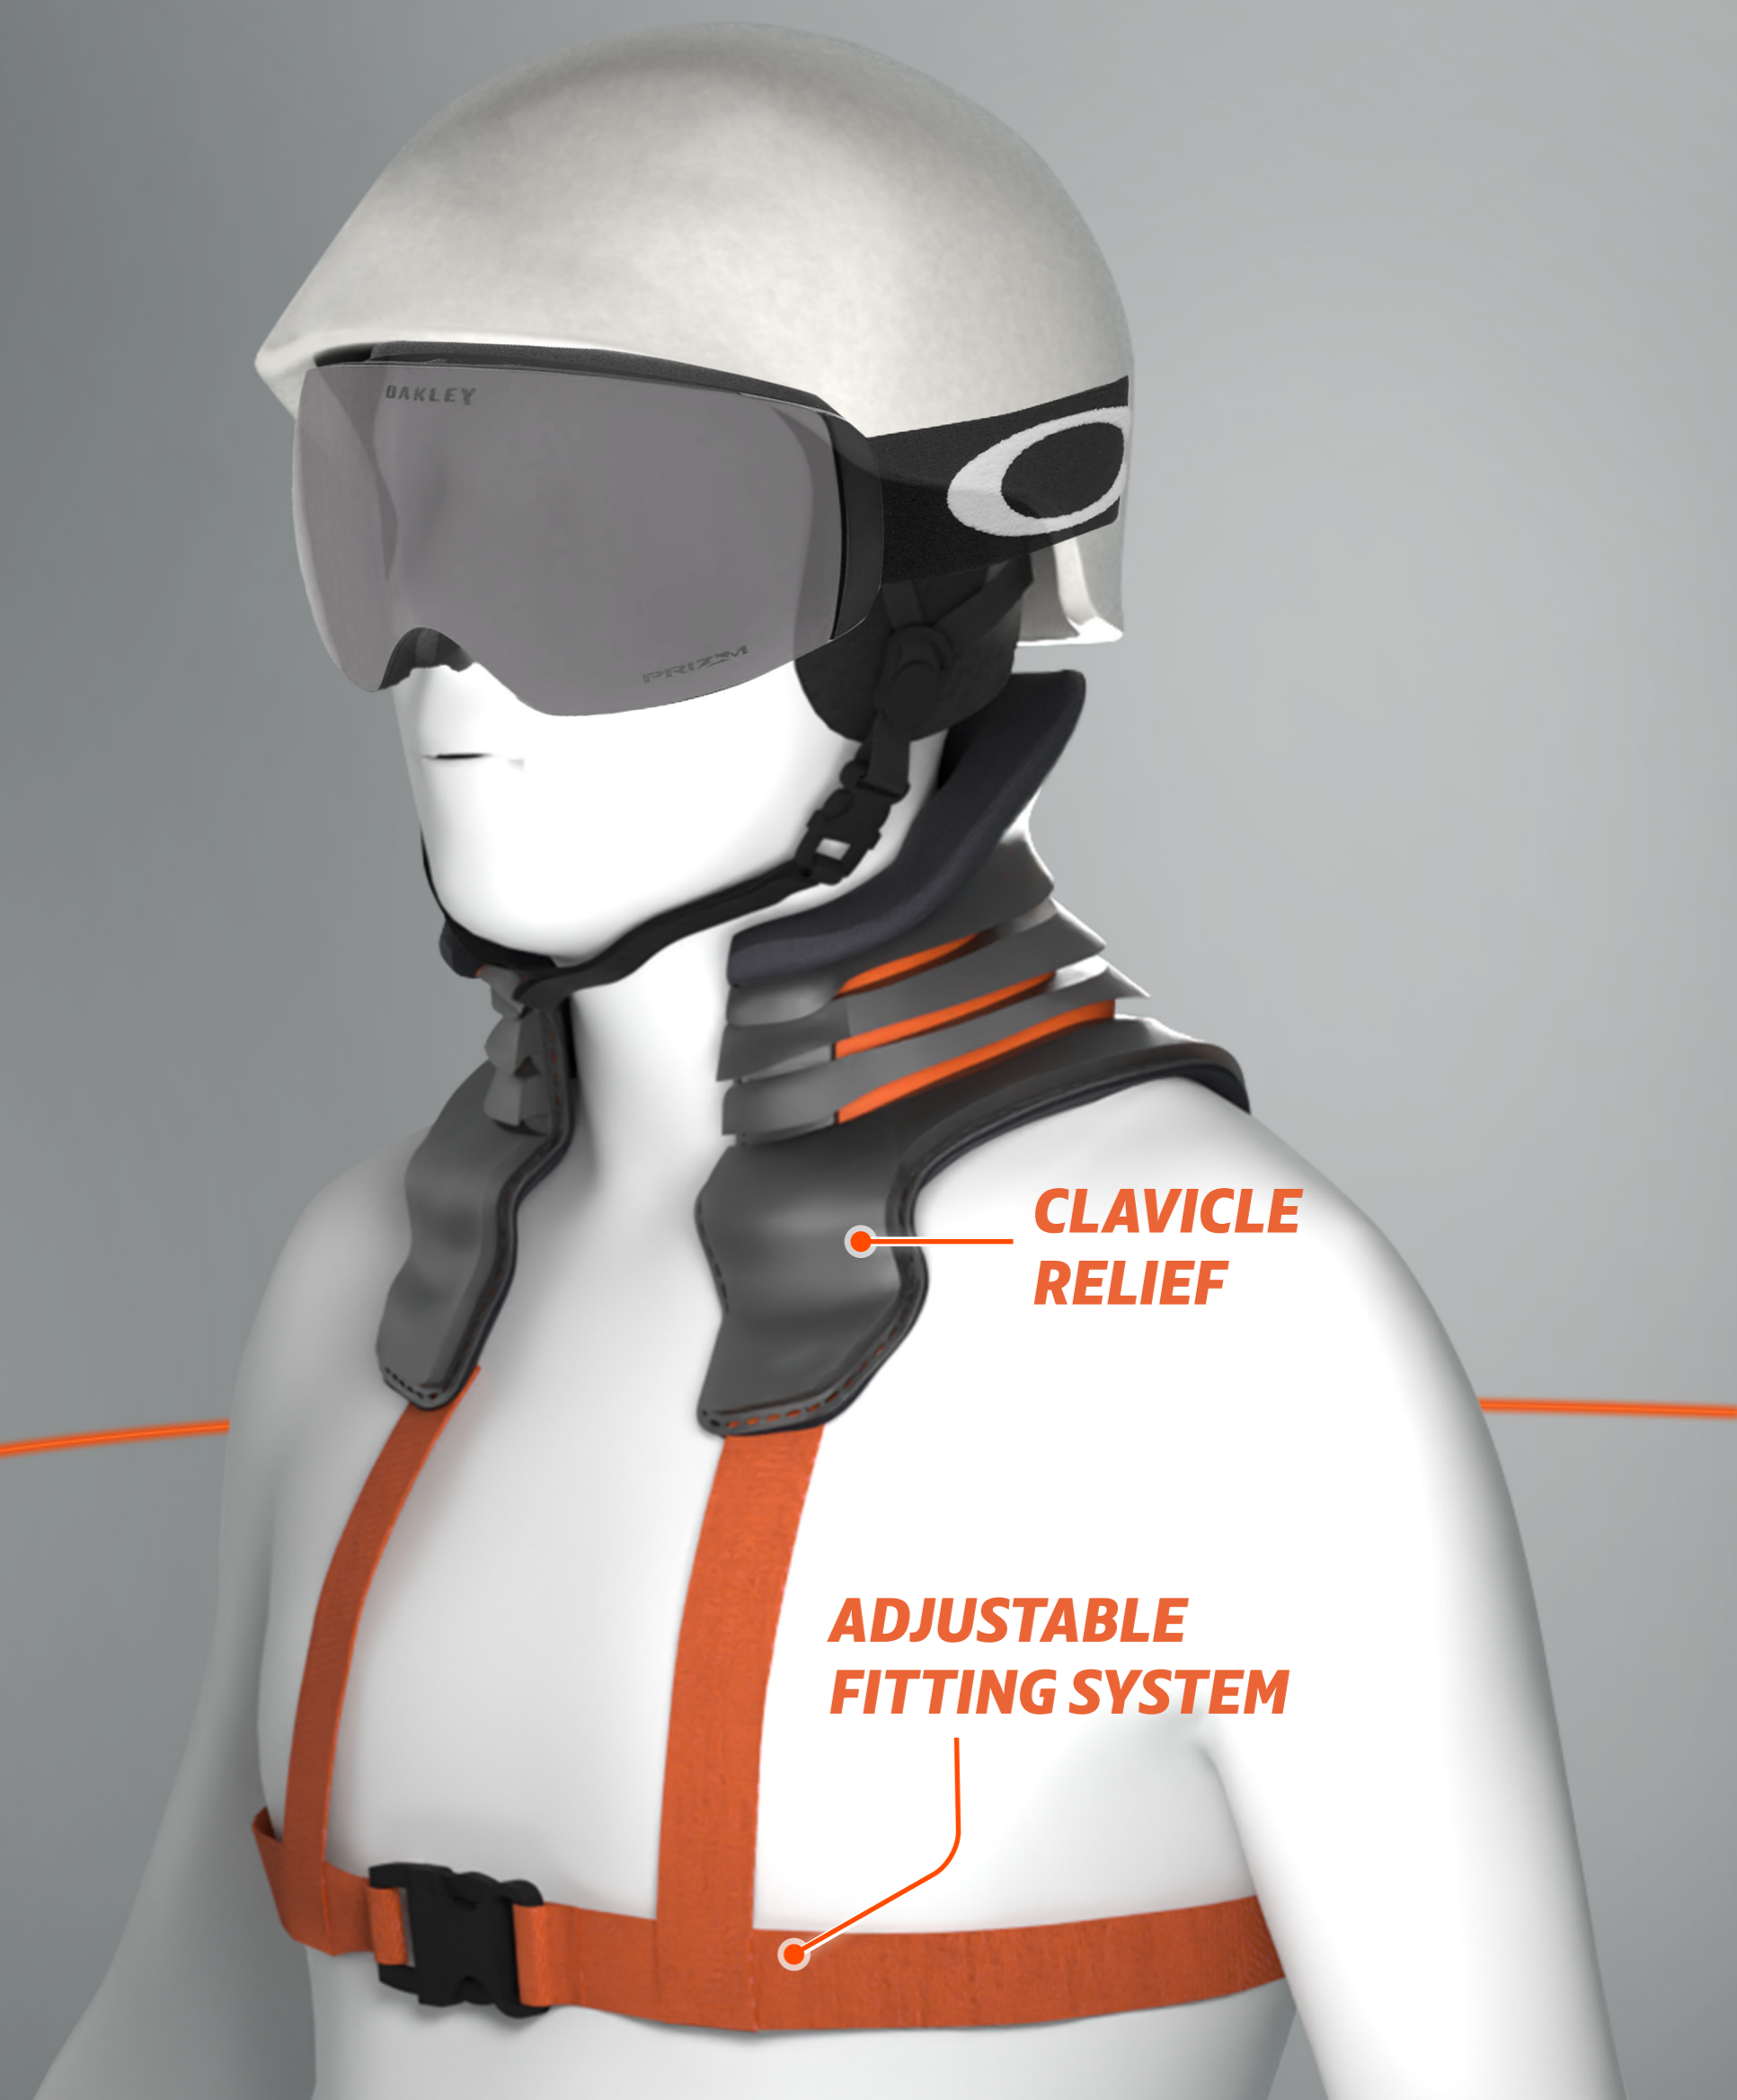

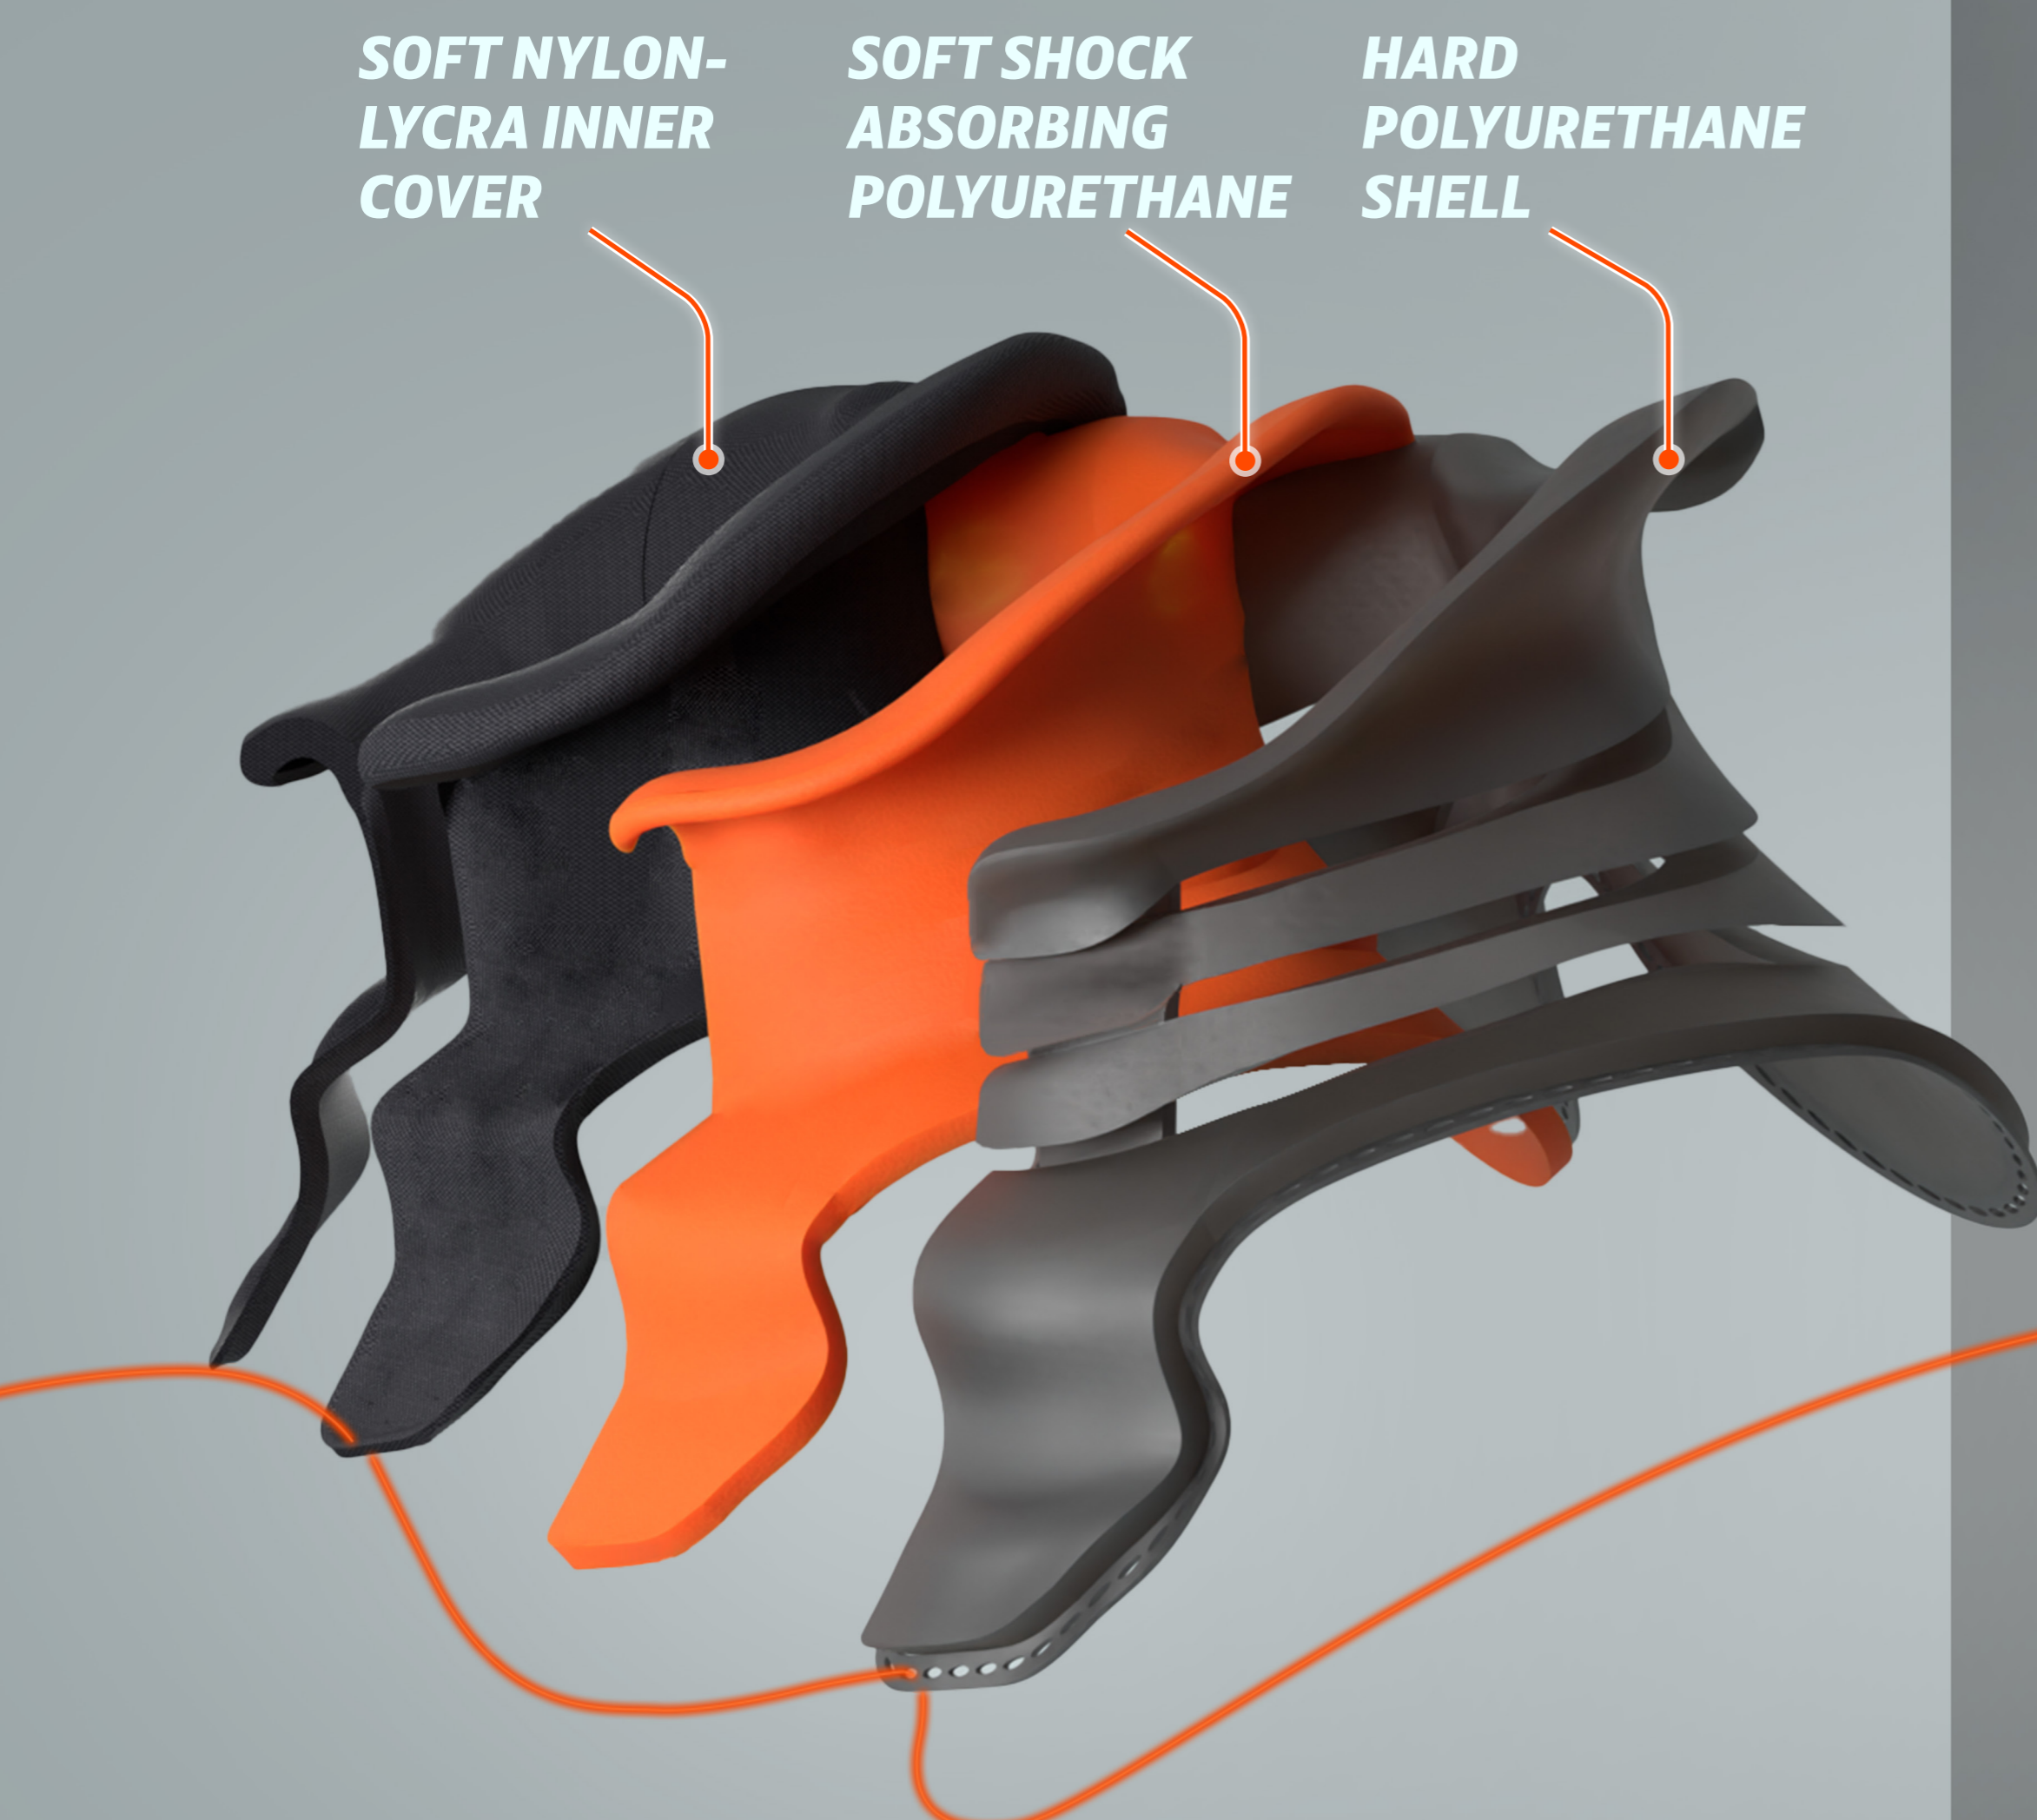

## Neck Protection for Winter Sports

There is currently no neck or cervical spine protection available on the market for winter sports. Between helmets and back protectors, which guard the thoracic and lumbar spine, the neck remains vulnerable.

CERVI aims to bridge this gap in the protective gear. It protects the cervical spine from compression but allows lateral bending and rotation to a comfortable for the user degree. It is thoughtfully designed to not restrict the freedom of movement of winter sports enthusiasts and to be comfortable to wear. CERVI's main function is to transfer the impact by forward fall from compression and extension away from the spine and into the back and chest muscles.

To assure shock absorption and safety CERVI is made from two layers of Polyurethane (PUR) - an outer layer which shapes the product and its motion and an inner layer which absorbs the shock.

CERVI ensures you don't have to choose between safety and enjoying the mountain.
