Introduction

- Increasing number of sensors
- Sensor web
- Allows better understanding and management of our environment

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Understanding the sensor web

- **Sensor** Device to measure physical quantities and transforms them into electrical signals
- **Observation** Active acquisition of information from a primary source
- **Sensor Web** Group of interoperable web services which all comply with a specific set of sensor behaviours and interfaces specifications
- **Standard** Formulation, publication, and implementation of guidelines, rules, and specifications for common and repeated use, aimed at achieving optimum degree of order or uniformity in a given context, discipline, or field

Sensor data in the built environment

*Why important for **citizens**?*

- Use and reuse of sensor data in applications
- Objective observation of phenomena
- Measure life quality

*Why important for **sensors maintainers**?*

- Updated technical sensor information
- More time efficient sensor maintenance
- Maintenance and configuration at distance

Understanding sensor data

- Sensor data accessed in applications
- Transformation required:

1. Introduction

Abundance of standards

- **SensorML**
 - Sensor Alert Service
 - Sensor Observation Service
 - Observations & Measurements
- **Semantic Sensor Network**
 - Semantic Sensor Network
 - SensorML
 - Pub/Sub
- **SemSos**
 - Generic Sensor Api
- **Sensor Event service**
- **SensorThings API**
- **Sensor Planning Service**
- **IEEE 1451**

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Research scope

- Create insight:
 - Define requirements
 - Research Sensor Web's technical capabilities
 - Create UML model
 - Order standards

Use case supported research

Towards interoperability between standards

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

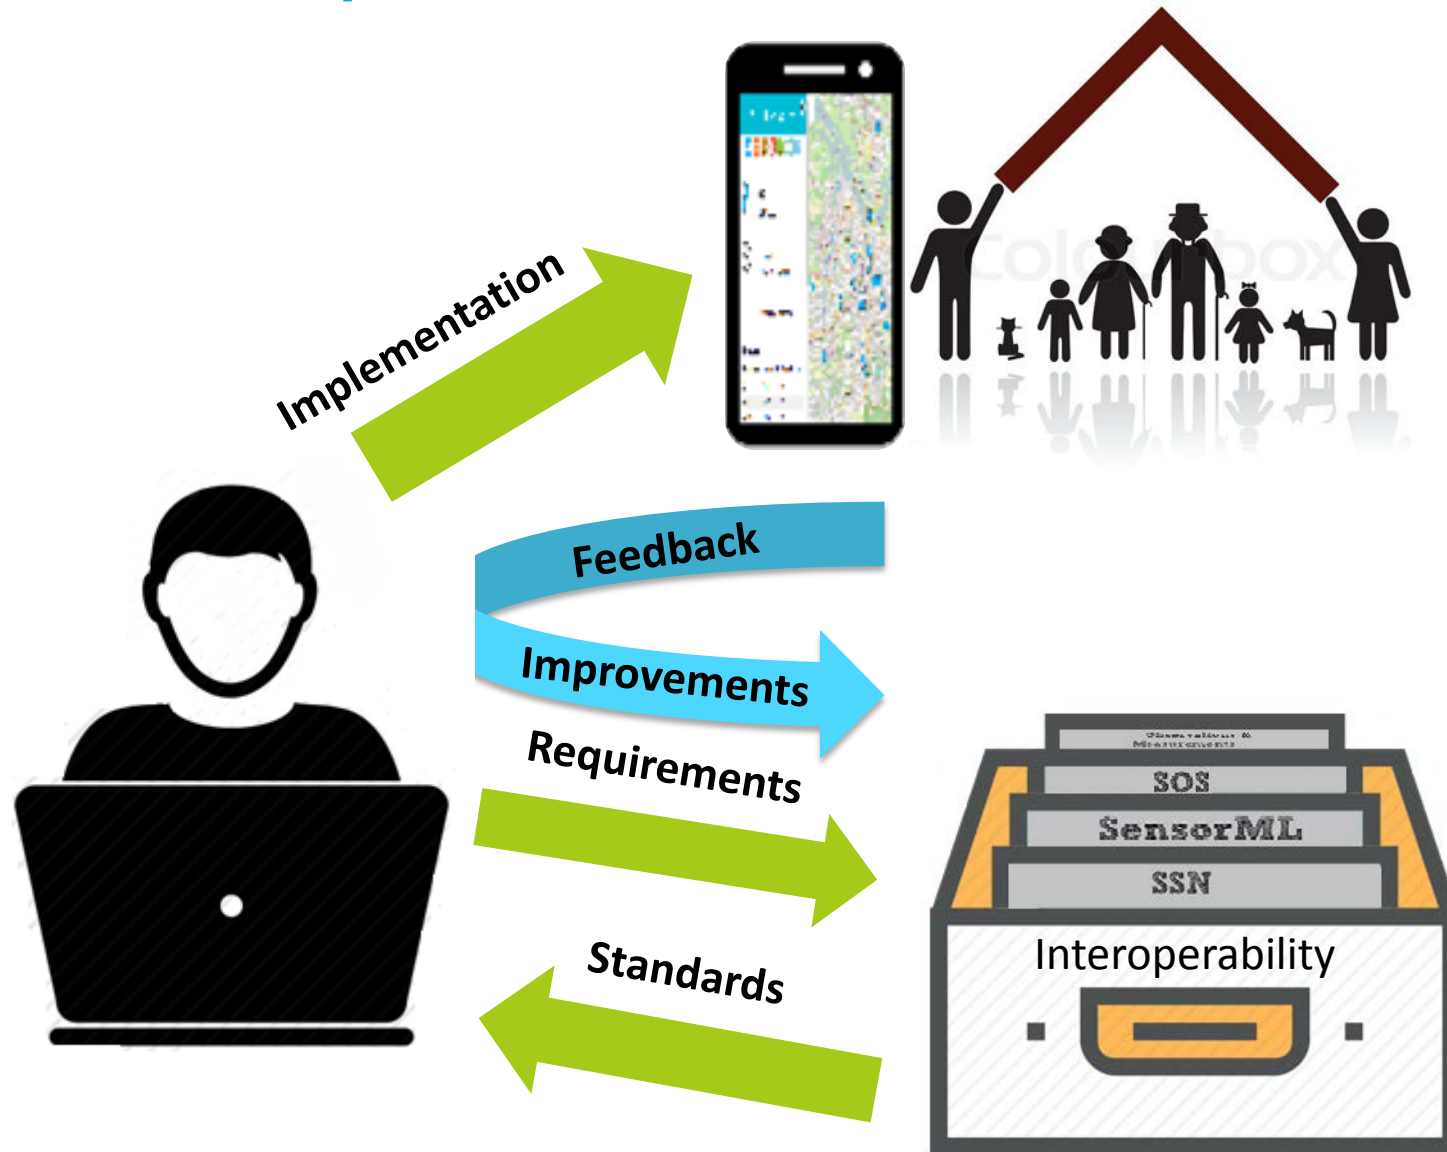

7. Results

8. Conclusions

9. Limitations

10. Future work

Preparation & research

- Desk research
 - Use cases
 - Technical capabilities standards
 - Data structure/ semantics
- Interviews
 - Demand citizens/ maintainers
 - Supply developers
 - Technical requirements

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

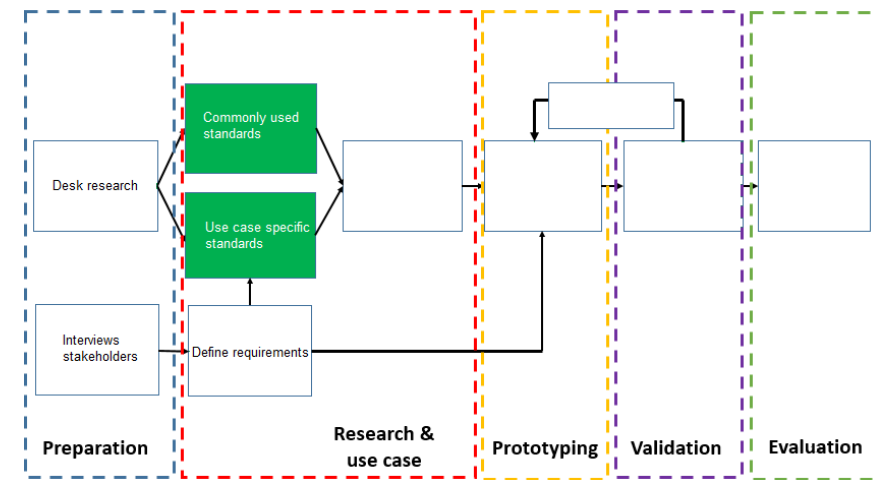

Commonly- & use case specific standards

Commonly:

- 5 Standards are compared
- Selected on:
 - Relevance for the use case
 - Frequency of hits on google

Use Case Specific:

- Depending on the Project Team

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Alignment

- Based on technical requirements

Requirements

Interviews

- 3 interviews experts
 - Network Maintainer
 - Calibration expert
 - Data analyst
- 6 meetings citizens
- 4 project meetings data experts
- 5 project group meetings

Interviews

- Results:
 - Citizens
 - Clear calibrated observation data
 - No gaps in sensor data flow
 - Real time sensor data
 - Historical sensor data
 - Maintainers
 - Device information
 - Maintenance history

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Validation of the UML model

- Requirements maintainer not fulfilled
- Half of the requirements met without standardization
- Sensor Observation Service mostly used for standardisation

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

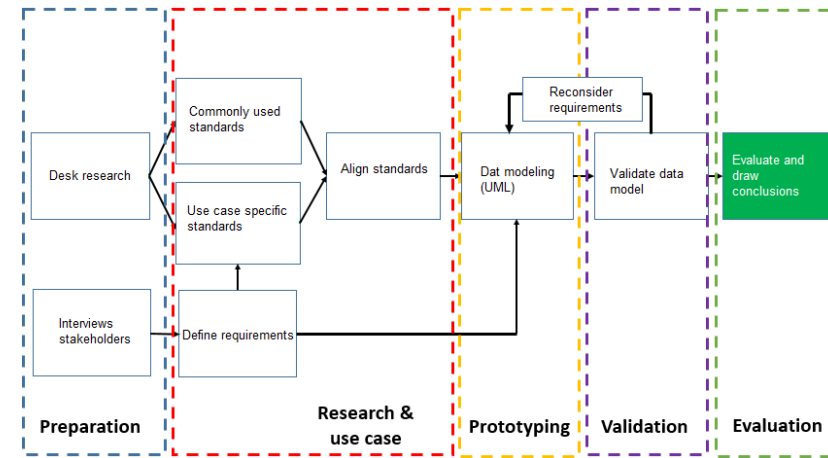

8. Conclusions

9. Limitations

10. Future work

Evaluation of the use case

- Geo & sensor standards used:
WMS, WFS, SOS
- Another standard planned: SensorThingsAPI
- Observation standards, no device standards
- Adding more semantics required
- Most of the requirements met
- Finding fitting standards is time consuming
- Several applications required
- **Ordering of standards is required**

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Bringing order

- Why ordering:
 - Inventory and ordering of standards
 - Developer can easier pick a standard
 - Standards can be better fine-tuned and adapted
- Adapting the Open System Interconnection (OSI) model

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

OSI model

- What does it contribute?
 - Used as a model for the Internet and Internet of Things standards

Review:

Project Smart Emission

Link: smarteremission.nl
Standards: SOS, WFS, WMS-Time, SensorThingsAPI
Product delivery: 2016
Responsible: Geonovum, Municipality Nijmegen, RIVM, Intemo

Smart Emission - Data Platform

De is het Smart Emission Data Platform. Deze levert toegang tot de data uit de Smart Emission sensoren via web services (web APIs) en een desktop app. Deze site en onderliggende diensten zijn ontwikkeld door Geonovum en draait samen met France 3.000. De algemene Smart Emission website vindt je op www.smarteremission.nl. Het Smart Emission project draait om het in kaart brengen van luchtvervuiling, gezond, leefbaar en milieuvriendelijke indicatoren in de stad op een dynamisch schaalniveau, maar met name met progressieve burger-sensoren-netwerken. * bron: nl.wikipedia.org

Apps

- SmartApp - voor Mobiel/Tablet
- SmartApp - voor Desktop
- SOS Viewer (Dashboard) - Timeseries, Charts, Download History

APIs

- SOS REST API - JSON/XML REST API alleen voor realtime waarden
- SOS API - SOAP - Full SOS API voor alle (historische) waarden - (SOAP)
- SOS REST API - SOAP - SmartEmission SOS REST API voor alle (historische) waarden - (SOAP)
- SOS API - WMS including WMS Capabilities for Time
- WFS API - WFS, e.g. for Download Timeseries

Download Timeseries

Download of retrieval (validation, calibration, aggregated) and raw timeseries (history) data is possible in various ways. Apart from the SOS/WMS/WFS APIs above data can be downloaded via the Viewers.

52North Viewer (SOS)

See the SOS Viewer (SOSviewer). When viewing the Chart, click in "Y" (Info) button on the right under each component. NB: There is a known bug in the 52North Viewer: the download

7. Results

8. Conclusions

9. Limitations

10. Future work

Future of the Adapted OSI model

- Maintenance required
- Cooperation stakeholders and standard organizations required
- One organization needs to be responsible

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Conclusions

To what extent align existing **sensor standards** for describing both **observations** and **sensors**?

- Situation sensor web: rapid developments, a lot of standards, no overview.
- Standards not sufficiently harmonized
- Sensor standards focus on a small section in the sensor web.
- Sensors and observations should have both equal importance in UML models
- Having one universal standard for the sensor web currently limits the flexibility of the sensor web

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Conclusions

What steps can be taken to **harmonize** standards in the **sensor web**?

- Collect the available standards
- Make an alignment
- Make a UML model based on the use case
- Remove duplications, fill gaps in the data model
- Validate the data model using use case requirements
- Order the standards in an ordering model
- Maintain the ordering model

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Limitations

- One use case: air quality
- Standards can cover more than one layer
- The layer definitions are broadly defined
- Vague boundary geo-standard and sensor standard
- Process not automated yet

1. Introduction

2. Problem statement

3. Research scope

4. Research question

5. Methodology

6. Use case

7. Results

8. Conclusions

9. Limitations

10. Future work

Future work

- Check if specifications are in other standards.
- Make an overview of possible implementations and best practices discoverable online
- Keep the model up-to-date
- More use cases need to be tested
- Involve sensor standard creators
- More use of Semantic sensor standards

Thank you for your attention!

Special thanks to

- Michel Grothe for help at geonovum,
- Wilko Quak and Bastiaan van Loenen at TU Delft

Raw Sensor Data

Standard	Observations & Measurements	SensorML	Sensor things API	Semantic sensor network	Sensor Observation service
Author	OGC	OGC	OGC	W3C	OGC
Architecture style	Resource Oriented Architecture	Service Oriented Architecture	Resource Oriented Architecture	Semantic Service Oriented Architecture	Service Oriented Architecture
encoding schema	XML, Json, OWL and Schematron for validation	Xml	REST, JSON, OASIS OData and URL	OWL	SensorML
Focus	XML implementation of schemas for observations, and for features	Restriction of sensor description, and sensor discovery	interconnects IoT devices, data, and applications over the Web	describes sensors, observations, and related concepts	Web service interface to query observations, sensor metadata, and representations of observed features.
Binding	SOAP	Sensor Markup Language	REST	OWL	SOAP, REST via extension
Insert new sensors and observations	Not Supported	Not Supported	HTTP POST	Not Supported	SOS specific interface: RegisterSensor() and InsertObservation()
Delete sensors	Not Supported	Not Supported	HTTP DELETE	Not Supported	SOS specific interface: DeleteSensor()
Updating Properties of Existing Sensors	Not Supported	Not Supported	HTTP PATCH and JSON PATCH	Not Supported	Not Supported
Deleting Existing Observations	Not Supported	Not Supported	HTTP DELETE	Not Supported	Not Supported
Pub/sub support	Not Supported	Not Supported	MQTT and SensorThings MQTT Extension	Not Supported	Not Supported
Pagination	Not Supported	Not Supported	\$top/\$skip/\$nextLink	Not Supported	Not Supported
Linked Data Support	Not Supported	Not Supported	JSON-LD	Not Supported	Not Supported
Usage	Core for other standards vb. Observation Data Model 2.0	IOOS® Sensor Observation Service,	resource-constrained device on top of the OpenIoT middleware	SPITFIRE FP7 project, 52North, emsorGrid4Env, xalted project	52north, PySOS, Deegree, MapServer
Geolocation	GML: point	Supported by CRS and Long lat alt	Every "thing" has a location	Does not describe location module Platform gives location	GML:Point
Meta data sensor	Earth Observation metadata	Uses Common Data Models	Metadata from sensor systems	Semantic meta data	Sensor meta data can be queried
limitation	No prototype yet with only UML More work on reference systems needed	Doesn't support describing workflows yet	Relatively new	Does not describe domain concepts time, locations, etc. Not easy to apply	Limitations are depending on the server Ex. 52North SOS does not scale very well
Strong point	Great observation model for other standards	Complementary role for CityGML and IndoorGML Everything is modelled as a process	easy to use interface to sensor values. simple resource based interface	powerful description framework of almost any kind of sensor observation	Implementation works for different servers

The OGC® OGC® Sensor Model Language (SensorML) Encoding Standard provides an information model and encoding for discovery & tasking of sensors

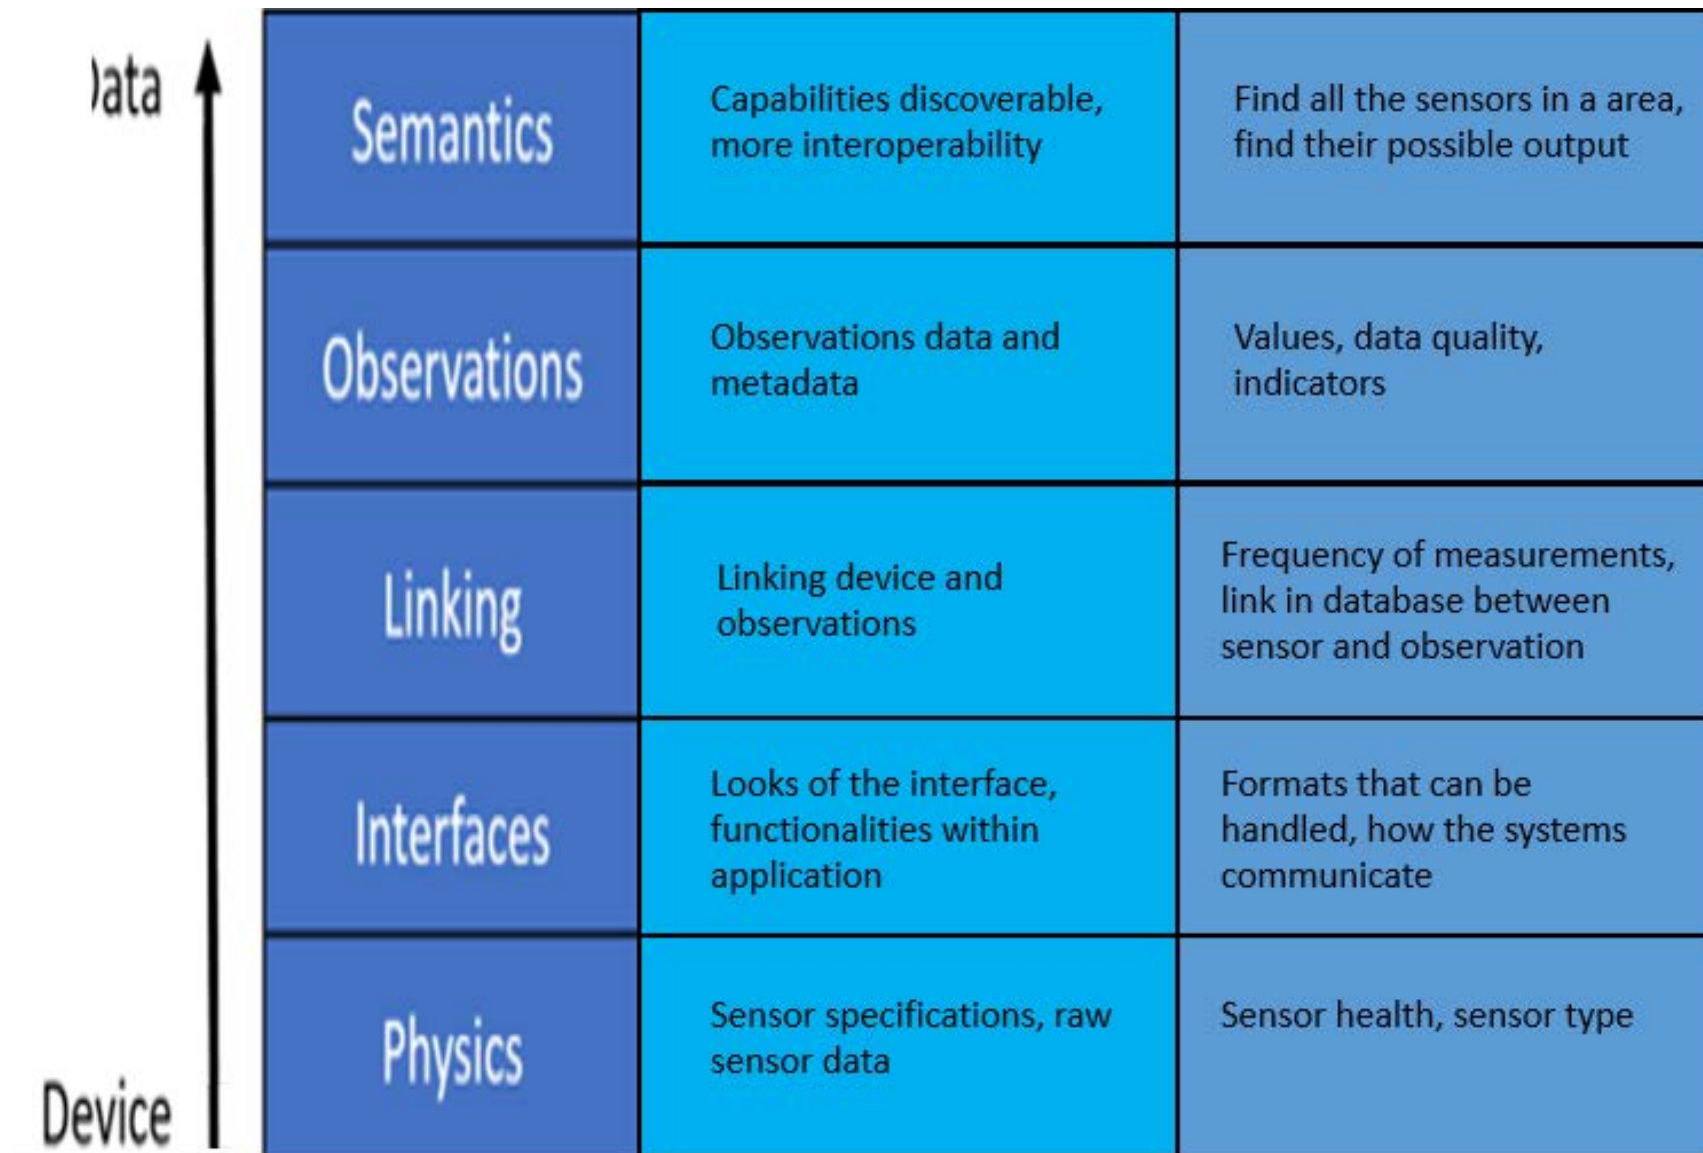

Source: OGC

OGC standards grouping

Semantics

- Semantics: spatial, temporal, and thematic semantic metadata
- Knoesis –Semantic sensor network
- Observation is an "act of measuring or otherwise determining the value of a property" and a measurement is a "set of operations having the object of determining the value of a quantity."

Contents layers
Adapted OSI model

Sub questions

- What are the commonly used sensor standards?
- To what extent do commonly used sensor standards align?
- Which sensor standard or standards are used in the Smart Emission use case?
- What steps can be distinguished to align the use case standard to the commonly used sensor standards?
