Canal Plus

moving to the bank

WHY RMIT ?

Assignment

MSc 4: Post-war areas, Utrecht
transformation of the southwestern areas (AR3Ar111)

Problem statement

The soutwestern areas of Utrecht was known for its industrial activities next to the channel. By the growth of the city the industrial areas become enclosed. Because of this expansion the industrial activity's can not function anaymore.

Therefore, most industry moved to adjacent industrial areas and the industrial site became vacant. These areas are often closed and a barrier for many residents.

Goal

Transformation of the whole industrial strip to a new urban fabric. Making the bank accessible for public en connected to the neighborhood. The ultimate goal is to zoom in on part of the canal project and redesign this chosen part until detail level.

Program

New structures

> Residential

Supporting diverse mix of people

* diversity is important to support the living area
* attracting people by creating different kind of living
* different group have different needs and bring different things
* the Neerlandia as public function needs residential

> Public function

The Neerlandia as a public building that facilitates the neigborhood

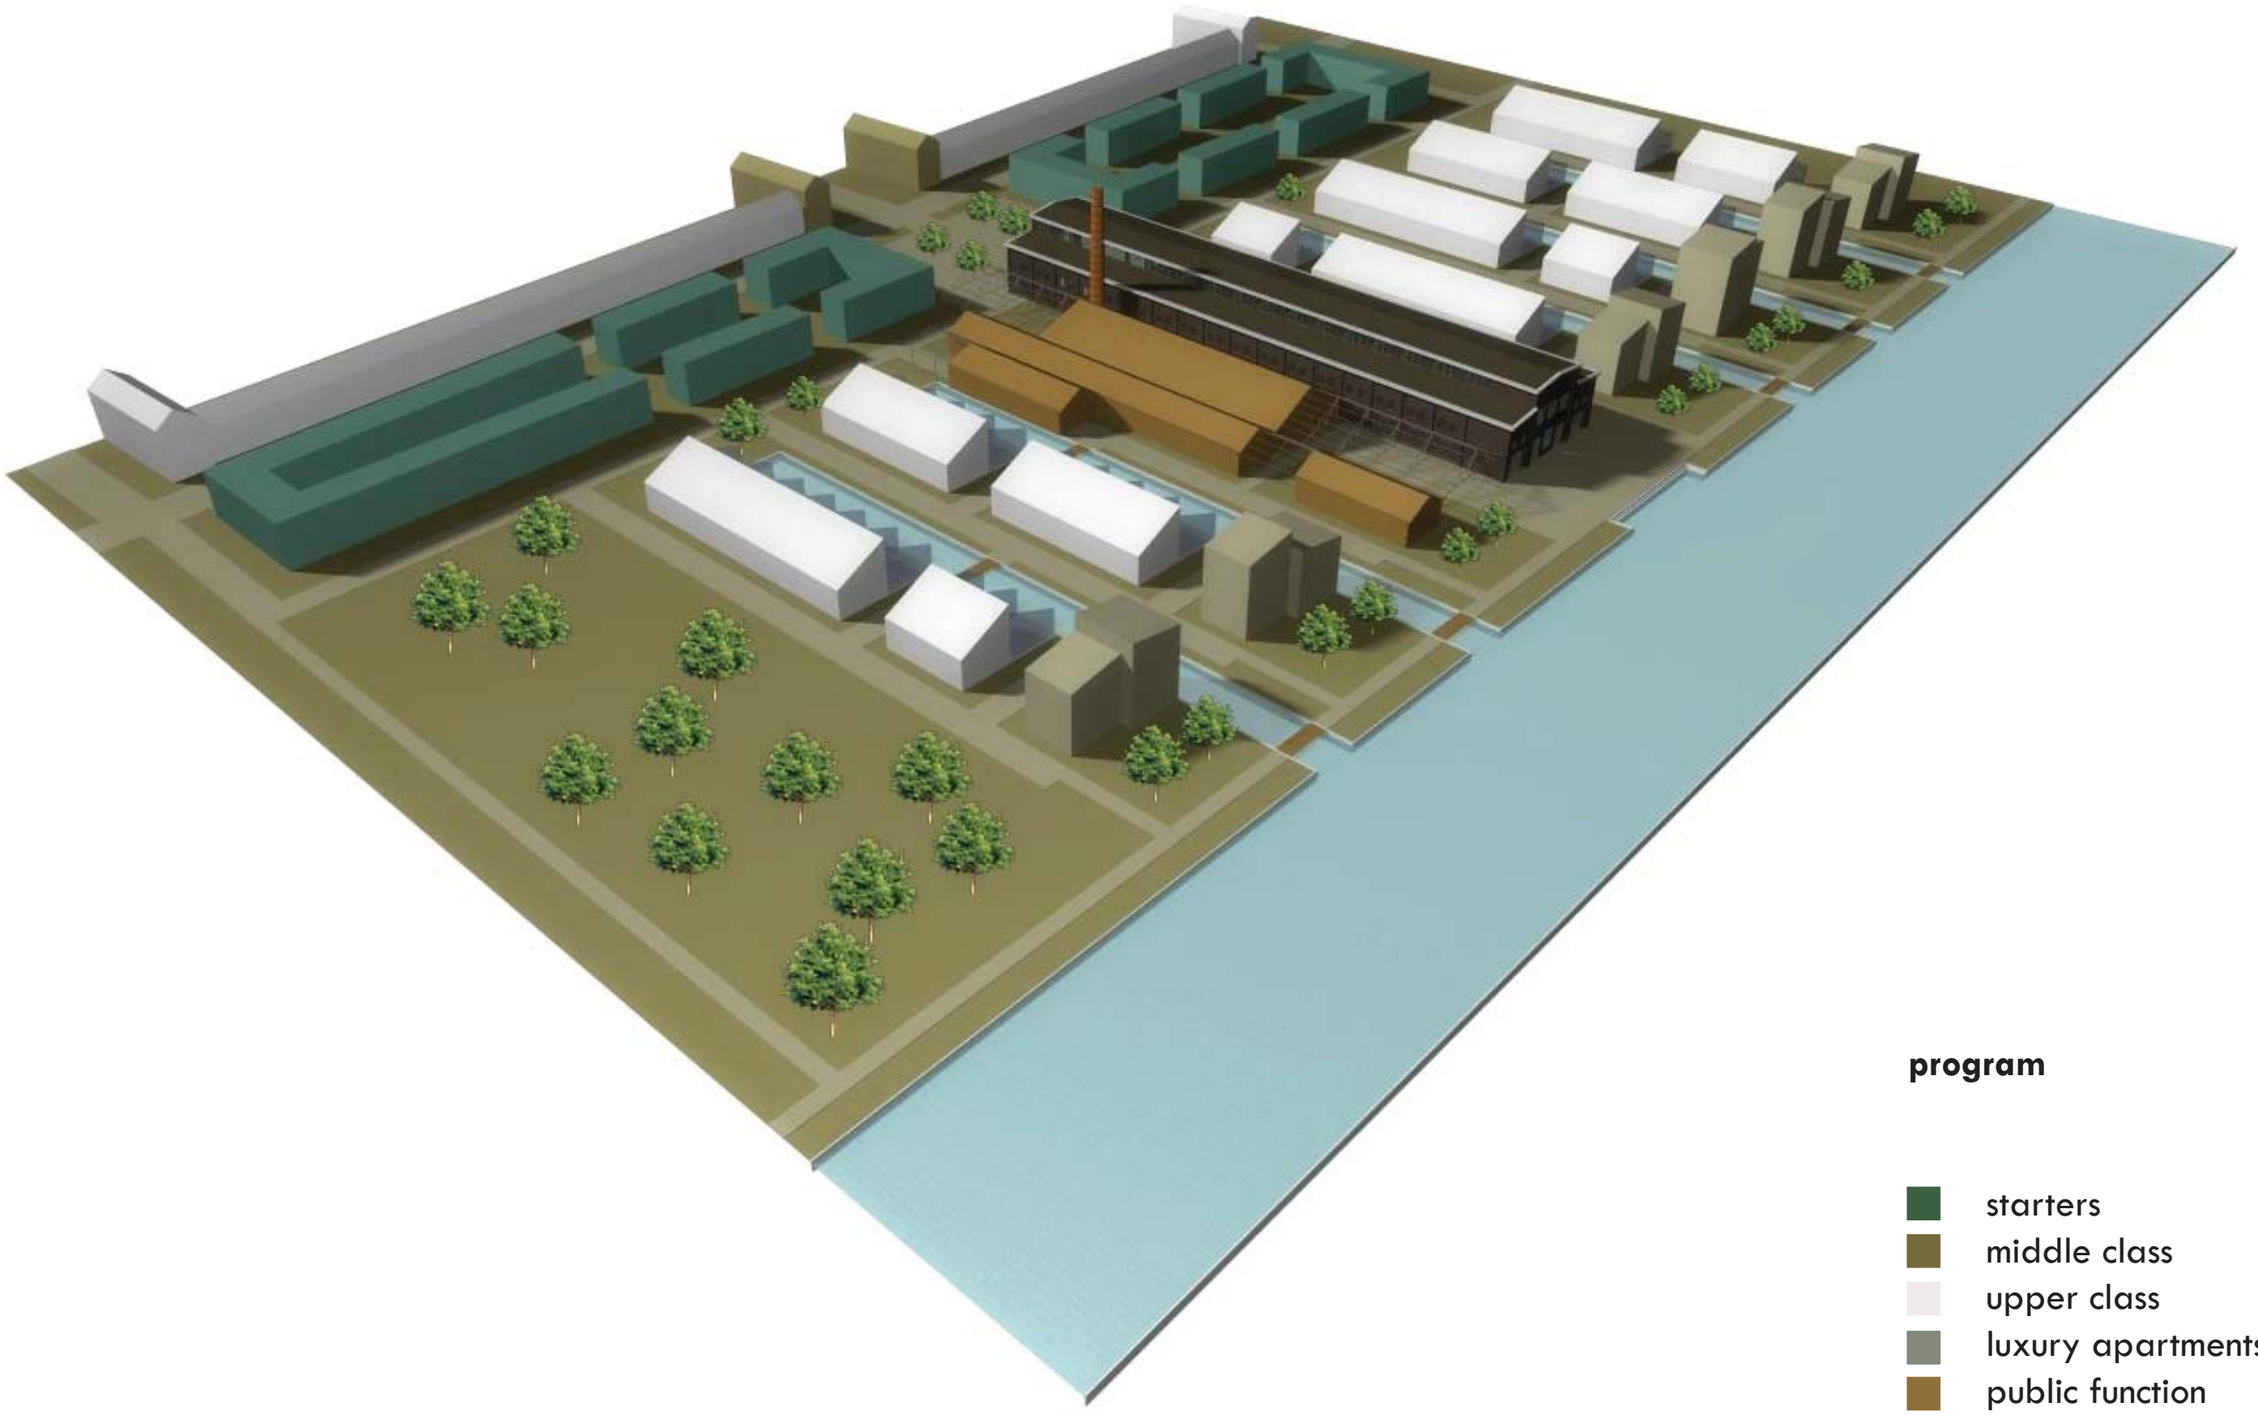
* functions based on the neighborhood
* services : daily living needs, health care, leisure, employment and community

> Parking : for new residential, existing residential & visitors

Preconditions, Principles & Values

toolbox as masterplan instrument
Neerlandia as a **attractor**
translation of the past
quality of the **water**

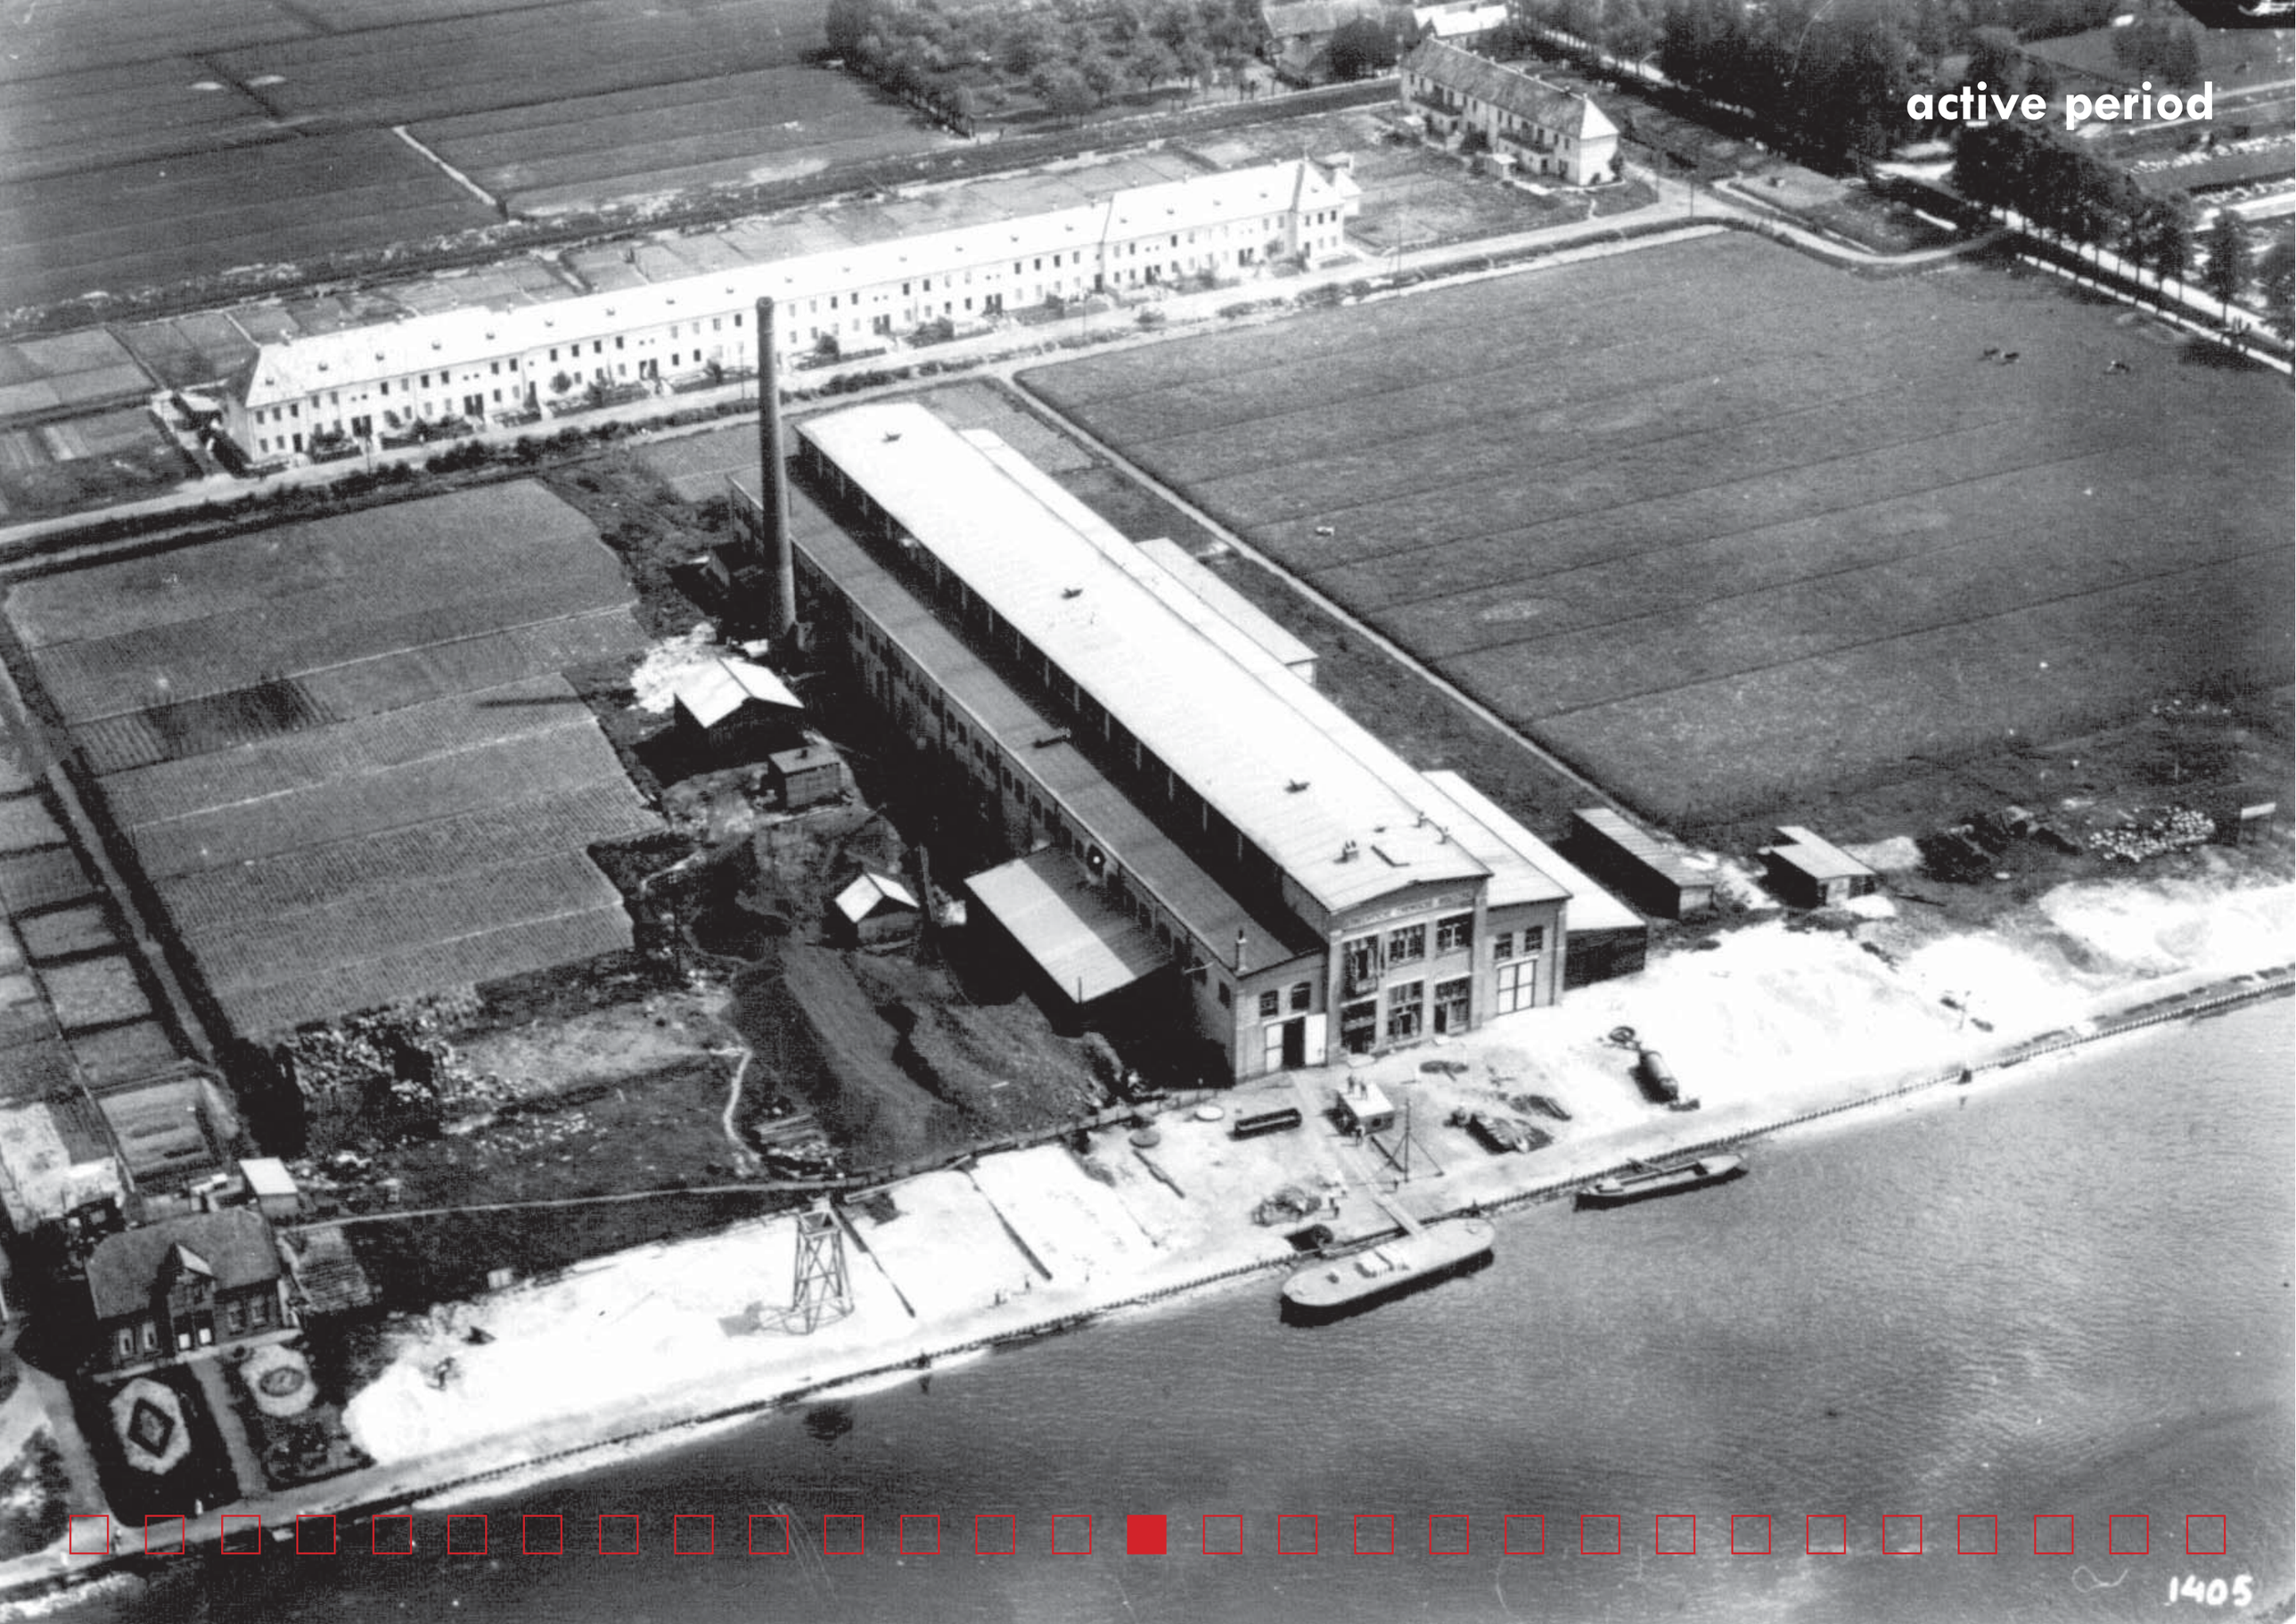
use of old **construction elements**
transport by water
focal point, **chimney**

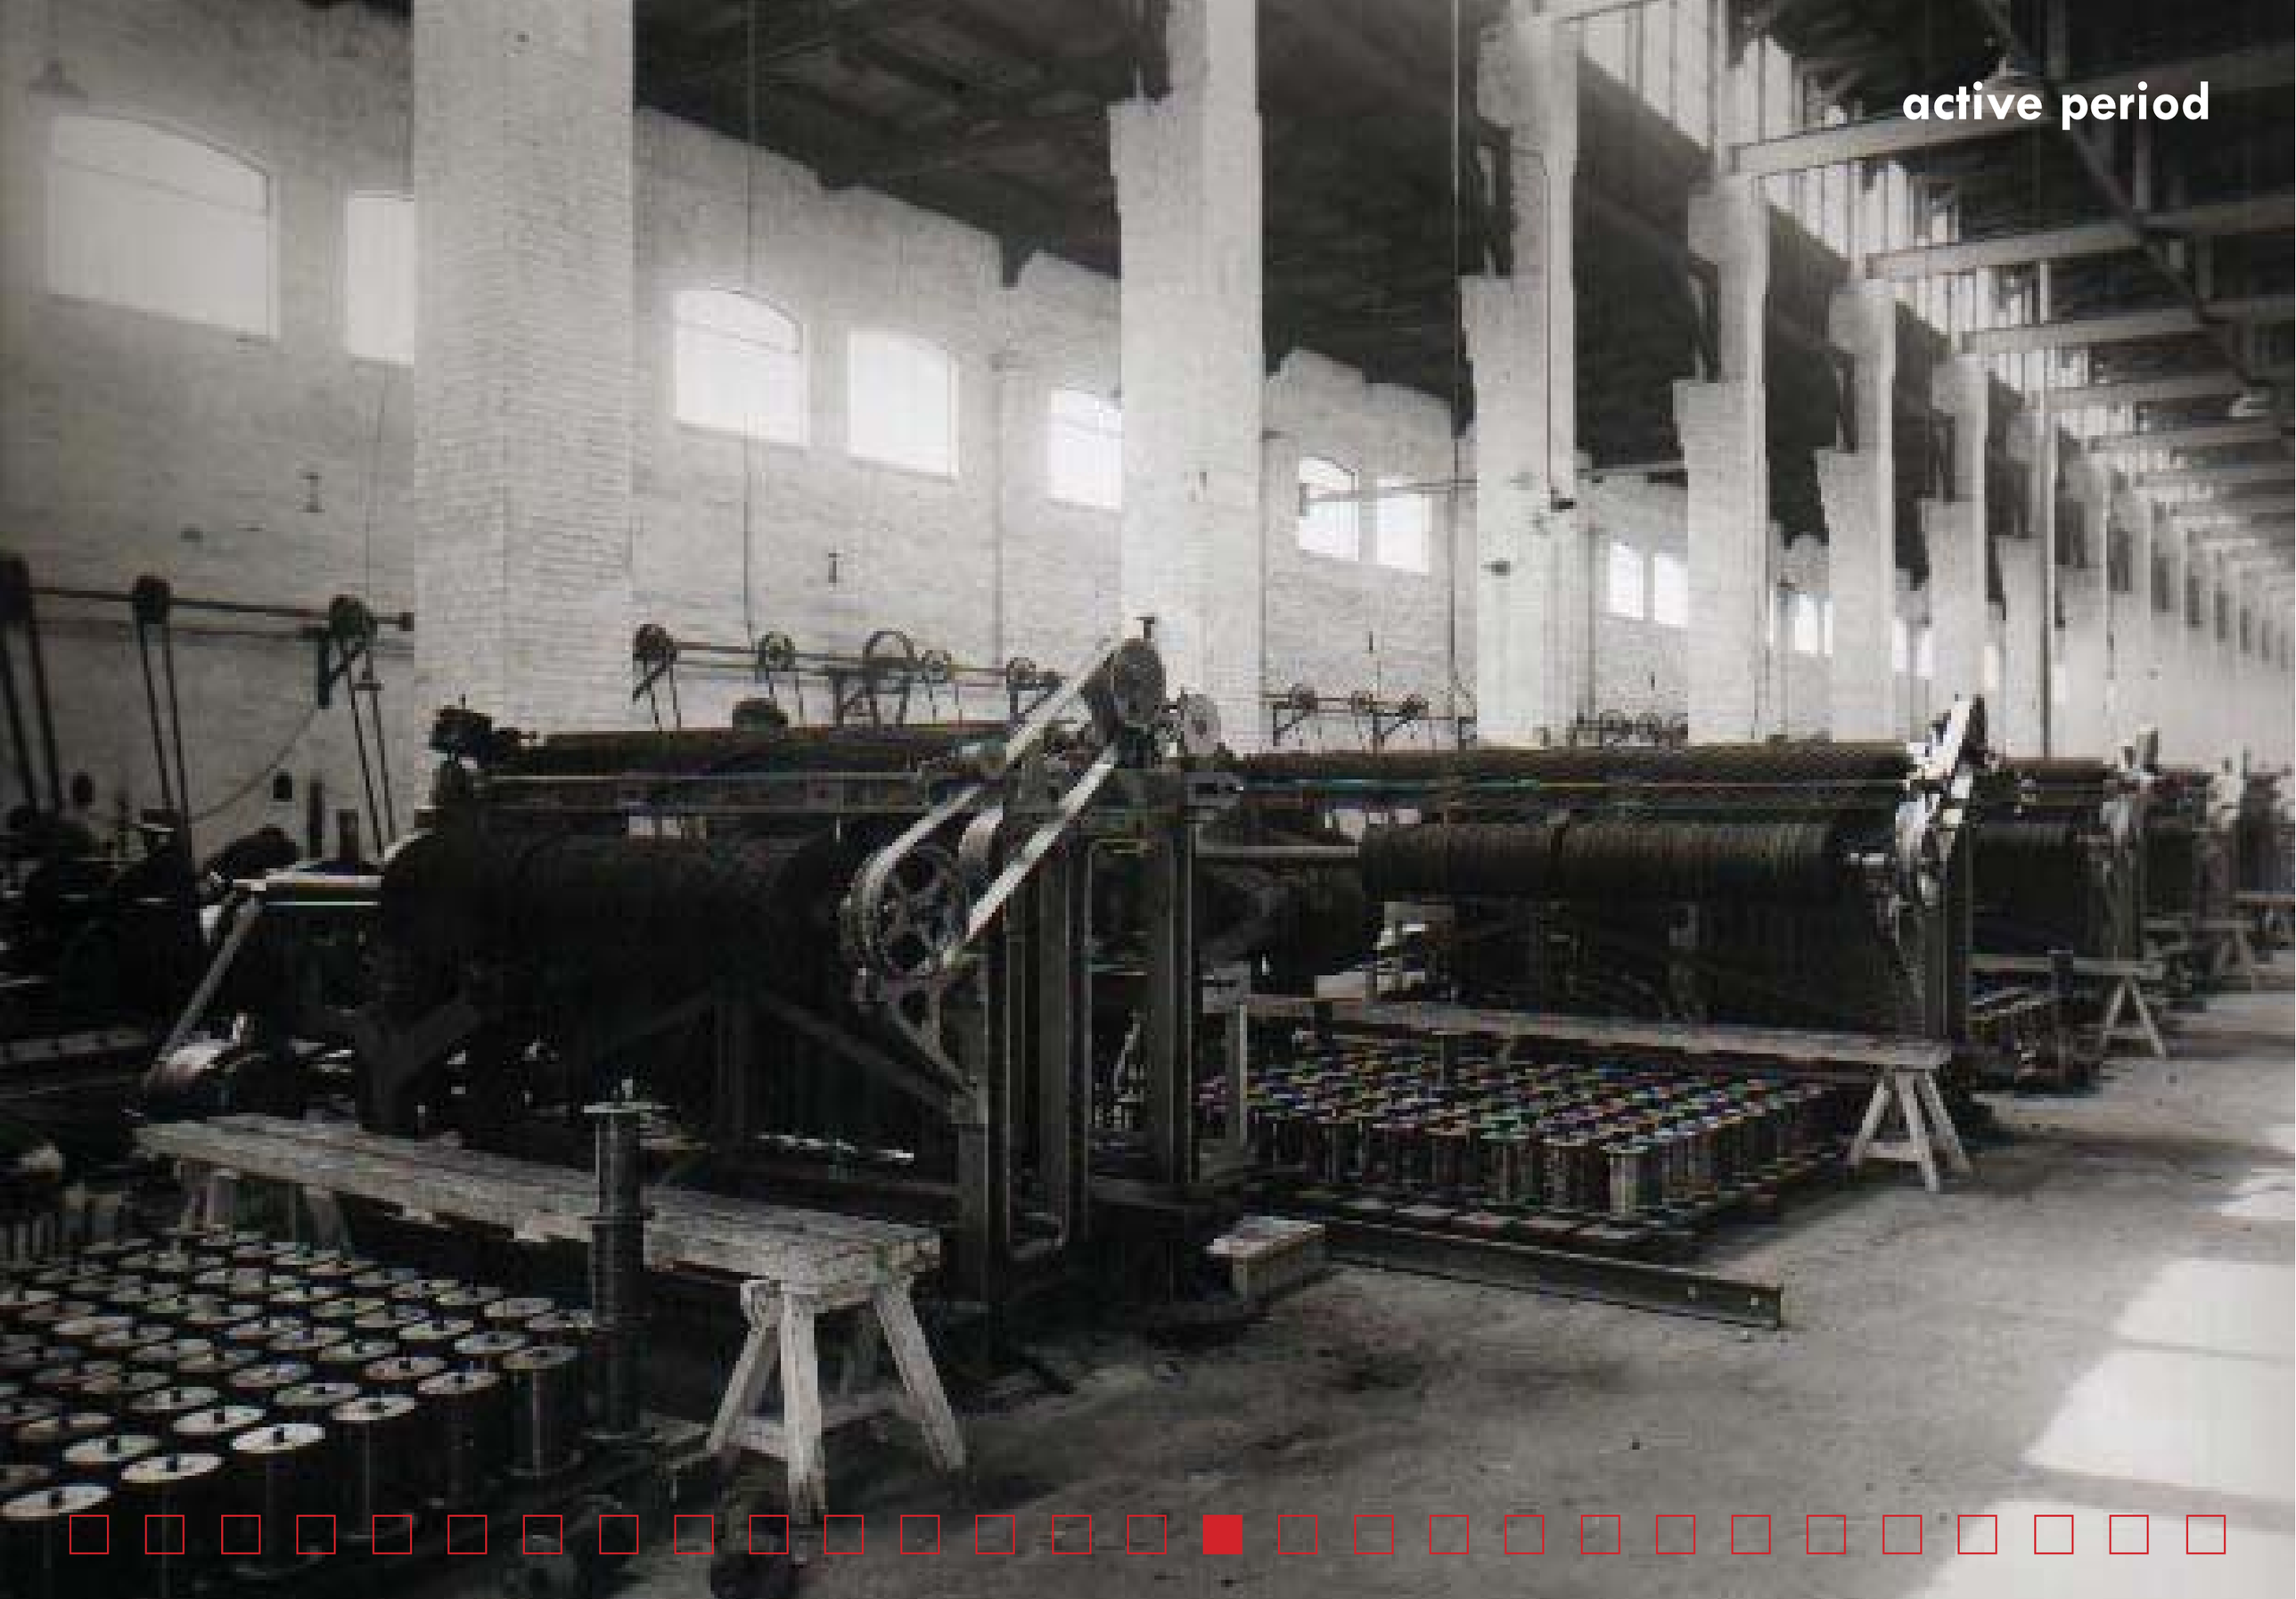


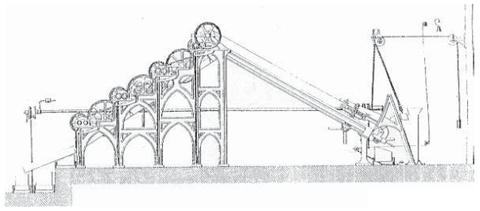
program

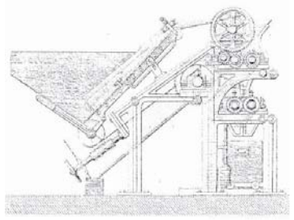
- starters
- middle class
- upper class
- luxury apartments
- public function

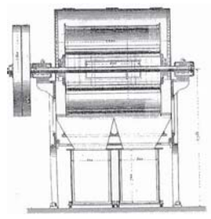
active period

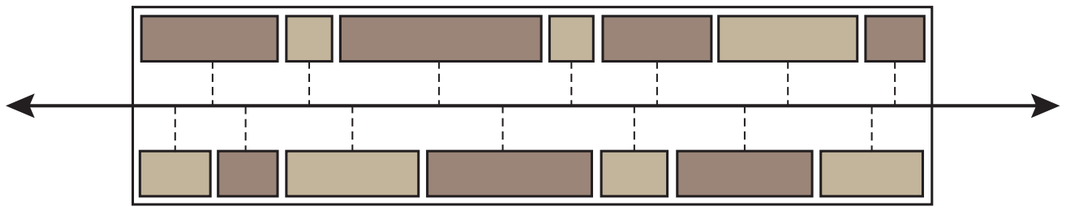








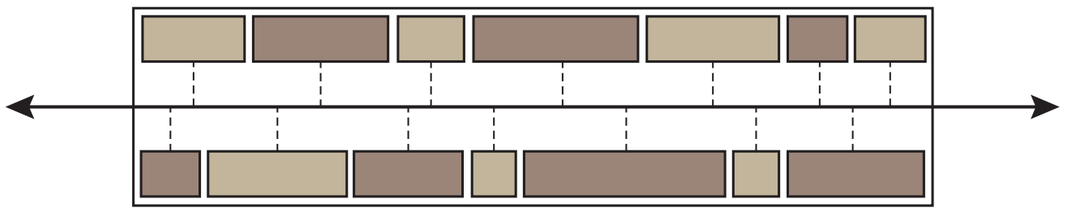




Building concept

Movement in the central nave by **production** is taking over by the **movement** of **people**

Side aisle - **storage** for production **products** becomes **storage** of products & **services**



Building program

The Neerlandia as a public building that facilitates the neighborhood

Functions based on the neighborhood

Services : daily living needs, health care, personal services, leisure, employment & community

Daily living needs	> supermarket, bakery, butcher, florist, fish
Health care center	> doctor, fysio, dentist, dental care, GGD, obstetrician
Personal services	> hairdresser, manicure, beautysalon
Leisure	> grand cafe, lunchroom
Employment	> the new functions creates employments
Community	> community center

Preconditions, Principles & Values

spatial quality, central hall
structural elements, **columns structure**
separating **wall**, remans of productionproces

functions (visual) connected with central nave
movement in the central nave
translation of the past

the daily living facilities, entrance H.C.C. > ground floor
leisure > located at the waterfront, terrace and view direct visual connected to canal.

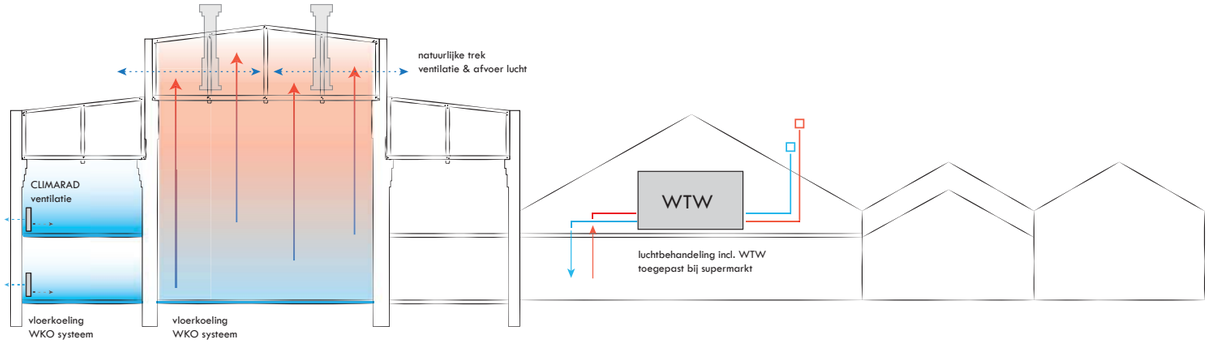
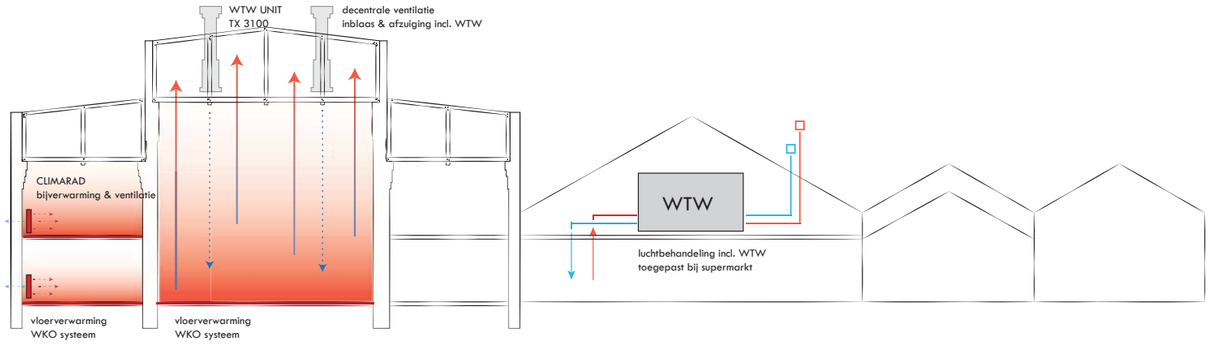
ZUID GEVEL - PATIO



SUMMER



WINTER

Ventilatie unit met warmte terugwinning dakmodel type TX 3100

Deze industriële warmteterugwinunit is speciaal ontworpen voor decentrale ventilatie in combinatie met een hoog rendement.

Toepassing

grote ruimte, magazijnen of werkplaatsen

Samenstelling

- Warmte wisselaar
- Afvoer ventilator
- Toevoer ventilator
- Toevoer filter
- Afvoer filter

Fan

- Ziehl Abbeg - EC ventilator
- qv = 3000 m^3/h

Warmtewisselaar

- Heatex warmte wiel
- Aluminium lamellen
- 1 module

Filter

- F5 afzuig
- F5 toevoer

Opties

- PIR sensor
- Hygrostaat
- C02 sensor

• Capaciteit

Te verplaatsen luchthoeveelheid in een ruimte gedurende een bepaalde periode wordt uitgedrukt in m^3/u of m^3/s.
Er worden verschillende methodes gebruikt om de capaciteit te bepalen.

1) Afhankelijk van het ruimte-gebruik wordt het aantal lucht-wisselingen per uur (VV/U) bepaald.

SOORT RUIMTE	VENTILATIEVOUD PER UUR
Openbare toiletten	5 - 15
Toiletten in woningen	3 - 4
Bad- en doucheruimten	5 - 8
Kantoren	4 - 8
Lakkerijen	15 - 20
Lakspuiterijen	30 - 80
Garages	4 - 6
Ontvangstruimten in hotels	4 - 8
Gieterijen	8 - 15
Bioscopen / theaters	5 - 8
Keukens in woningen	10 - 20
Middelgrote bedrijfskeukens	15 - 25
Grote bedrijfskeukens	20 - 30
Laboratoria	8 - 15
Magazijnen	4 - 6
Machineruimten	15 - 30
Montagehallen	4 - 8
Scholen	4 - 6
Zwembaden	5 - 7
Showrooms	4 - 8
Restaurants	5 - 8
Vergaderruimten	5 - 10
Wasserijen	12 - 15
Warenhuizen	4 - 6
Werkplaatsen	3 - 6

Bovenstaande ventilatievouden zijn slechts richtlijnen en niet nauwkeurig genoeg.
Verder kunnen voor het bepalen van de ventilatievouden een aantal normen gebruikt worden zoals die wettelijk zijn bepaald.

2) Ventilatievoud-berekening afhankelijk van het aantal personen en hun activiteiten in de ruimte.

niet rokende personen met normale arbeid:
20-25 m³/u per persoon

rokende personen met normale arbeid:
30-35 m³/u per persoon

personen met lichte lichamelijke arbeid:
45 m³/u per persoon

personen met zware lichamelijke arbeid:
60 m³/u per persoon

Dit zijn echter minimum waarden welke naar omstandigheden geïnterpreteerd dienen te worden.

3) Afhankelijk van de luchtsnelheid, noodzakelijk voor de opvang van stofdeeltjes of voor hun transport door kanalen:

AANZUIGSNELHEID	
Wasemkap	
huishoudelijke toepassing	0,15 - 0,20 m/s
industriele toepassing	0,20 - 0,25 m/s
verbrandingsgassen	0,25 - 0,50 m/s
ontvetting	0,25 - 0,50 m/s
lasdampen	0,50 - 1,00 m/s
galvanisatie	0,50 - 1,00 m/s
spuitcabine	0,70 - 1,00 m/s
slijpsel	2,50 - 10,00 m/s

TRANSPORT SNELHEID	
stof	9 m/s
bloem	13 m/s
zaagstof	15 m/s
fijn metaal stof	15 m/s
houtkrullen	18 m/s
metaalkrullen	20 - 25 m/s

Het volstaat om deze snelheid te vermenigvuldigen met het kanaaloppervlak om aan de juiste capaciteit te komen.

• Keuze van ventilatoren

De selectie van een ventilator dient te geschieden volgens de volgende criteria:

1) Type ruimte:
- industrieel
- commercieel
- huishoudelijk

2) De aard van de te transporteren lucht en zijn eigenschappen:
- zuivere lucht
- lucht met stof en/of vet
- transport van materialen
- vluchtige stoffen

3) Vorm en aard van de installatie
- lokaal, in onder- of overdruk
- ventilator in de wand, op het dak of in kanalen
- plaatsing van de luchtinlaat en -uitlaat
- speciale voorwaarden, temperatuur, hoogte enz.

4) De benodigde luchthoeveelheid en druk

5) Het toegestane geluidsniveau:
- in ruimten
- buiten

6) Het type elektrische voeding:
- enkel- of driefasig
- spanning

Andere belangrijke factoren waarmee rekening gehouden dient te worden voor de selectie van een ventilator zijn:

- afmetingen van de ventilator
- regelbaarheid in toerental
- verkrijgbare accessoires

• Ventilatie wetten

Deze leren ons de veranderende eigenschappen van de lucht te bepalen betreffende:
- de capaciteit (Q)
- de weerstand (Δp)
- de luchtsnelheid (P)
- het geluidsniveau (Lp)

De veranderende eigenschappen ontstaan ten gevolge van wijziging:
- toerental (RPM) (N)
- diameter van de waaier (D)

1) Bij gelijkblijvende diameter;

-varieert de capaciteit Q proportioneel ten opzichte van het toerental:

$$Q_2 = Q_1 \times \left(\frac{N_2}{N_1}\right)$$

-varieert de druk P kwadratisch ten opzichte van het toerental:

$$\Delta p_2 = \Delta p_1 \times \left(\frac{N_2}{N_1}\right)^2$$

-varieert het opgenomen vermogen P tot de derde macht ten opzichte van het toerental:

$$P_2 = P_1 \times \left(\frac{N_2}{N_1}\right)^3$$

2) Bij een vast toerental:

-varieert de capaciteit Q tot de derde macht ten opzichte van de waaierdiameter:

$$Q_2 = Q_1 \times \left(\frac{D_2}{D_1}\right)^3$$

-varieert de druk p kwadratisch ten opzichte van de waaierdiameter:

$$\Delta p_2 = \Delta p_1 \times \left(\frac{D_2}{D_1}\right)^2$$

-varieert het opgenomen vermogen P tot de vijfde macht ten opzichte van de waaierdiameter:

$$P_2 = P_1 \times \left(\frac{D_2}{D_1}\right)^5$$

• Omrekeningstabel

Volumestroom:		
1 CFM	=	1,699 m³/u
	=	0,472 l/s
