Master Thesis

# Self-Compacting Alkali-Activated Slag Concrete

## Development of mixture designs, material properties, life cycle analysis and market validation.

by

Deepanshu Mangla

in partial fulfilment of the requirements for the degree of

Master of Science  
in Construction Management & Engineering

At the Delft University of Technology, Faculty of Civil Engineering and Geosciences, Stevinweg 1, Delft.

To be defended publicly on Friday, November 26, 2021.

Student Number	4916239		
Thesis Duration	September'2020 – September'2021		
Thesis committee	Dr. ir. G (Guang) Ye	Thesis chair	TU Delft, Materials and Environment
	Ir. Shizhe Zhang	Daily supervisor	TU Delft, Materials and Environment
	Dr. ir. Ruud Binnekamp	CME supervisor	TU Delft, Construction Management and Engineering

*This thesis is confidential and cannot be made public until December 1, 2026.*

An electronic version of this thesis will be made available at <http://repository.tudelft.nl/>.

# Acknowledgements

This thesis is a result of my 3 years of studying at TU Delft. The covid-19 period was challenging, and it forced me to go back to India for almost 7 months. However, had this not happened, I would not have been a part of this thesis project. With my family in the concrete business for more than 17 years, it came as an idea to do a thesis on a topic close to concrete technology. I thank Dr. Ruud Binnekamp for his initial guidance in framing my topic and guiding me on the right approach to follow further.

I acknowledge Dr. Guang Ye to provide me with this opportunity to exploit my idea into practice. Even though I was a CME student, Dr. Ye believed that I would be able to contribute to this new topic of alkali-activated materials. I also thank him for introducing me to Shizhe Zhang, who has been the backbone of my entire thesis duration. From the day 1, Shizhe had constantly supported me with every query, even when I asked silly questions at times. I acknowledge the fact that he always pushed me to do things on my own. This helped me to challenge myself, avoid shortcuts and get a deeper insight into the subject. In addition, Shizhe helped and worked with me in the majority of the experiments.

For the concrete casting sessions, I also want to acknowledge the help of Dr. Hua Dong. He also helped in giving innovative suggestions for various subtopics in this thesis. I also thank Maiko for his support in several casting sessions and for keeping the lab atmosphere friendly and alive. I also acknowledge Tom Blom for assisting whenever I needed help in fixing lab equipments and being my rescue whenever some experiments went wrong.

I thank Fred Schilperoort and Dr. Zhenming Li for their help in TSTM, ADTM and bond pull out test experiments. Acknowledge Albina Kostiuhenko for her tutorial on conducting Elastic modulus and Poisson's ratio tests, and I appreciate the help of Jakub Pawlowicz and John Hermsen for their help in welding, wood and steel rebars cutting for the setup of bond pull-out specimens.

I acknowledge Ir. Jan de Koning, Ir. Wart Van de Velde, Ir. Wart Van de Velde and Mr. Mark Verkuijl for their time and interest in the topic and valuable insights through the stakeholder interviews.

I want to thank my friends in Delft and India, for their emotional support. Lastly, I deeply admire the never-ending support of my parents, who were always there for me. They also financially supported all of my education.
