# Research questions

## Main question

- What is the relationship between collaboration and innovation in the circular construction sector?

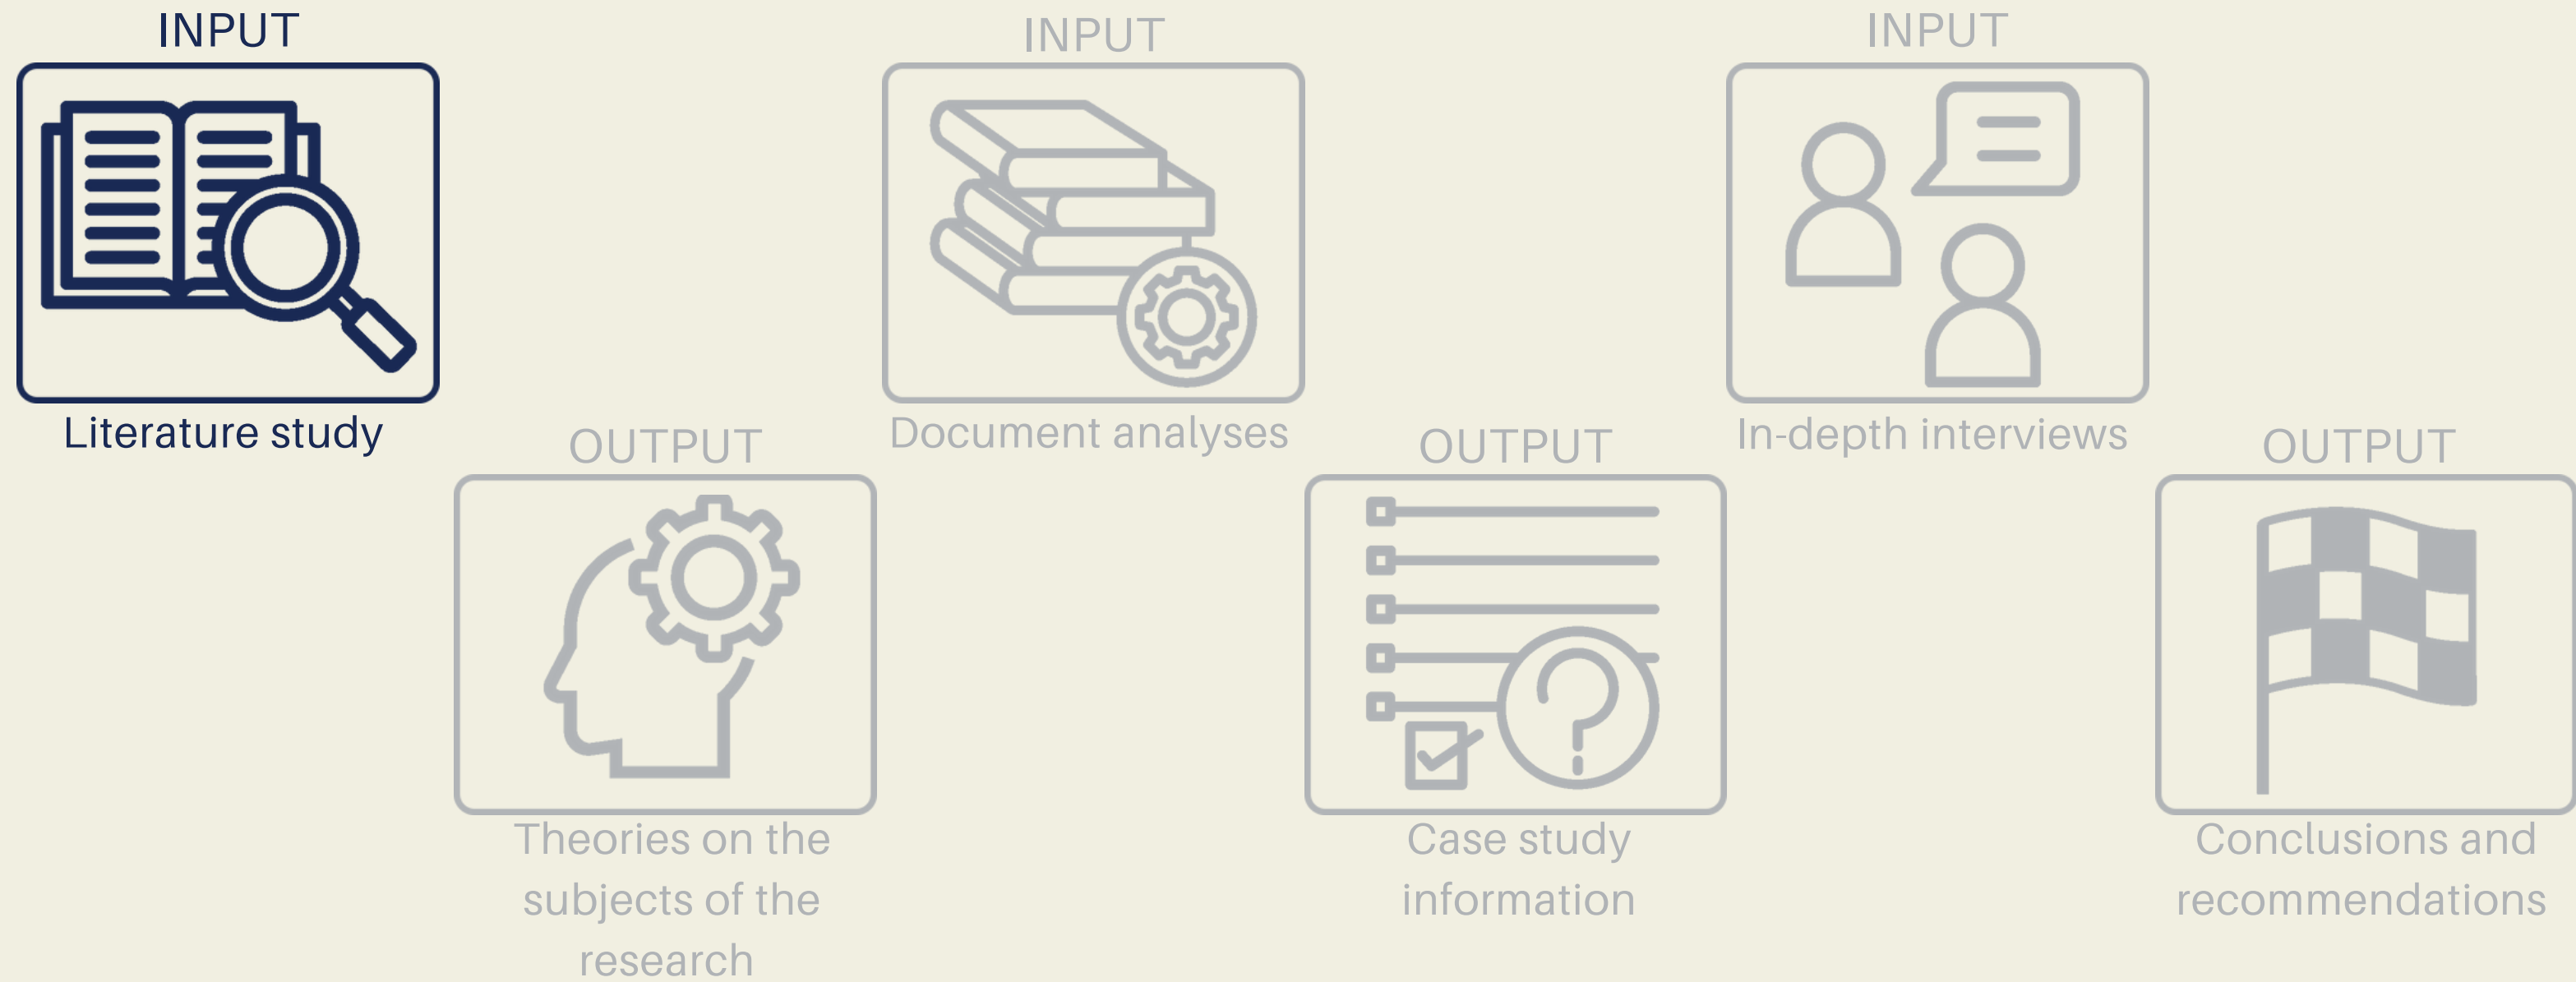

## Sub-questions

- RQ1: What kind of innovations are there in the circular construction sector?
- RQ2: What are the different elements of collaboration in the circular construction sector?
- RQ3: What are the factors that drive and prevent collaborations and innovation in the circular construction sector?
- RQ4: Who are the parties between whom collaboration should be established in order to facilitate innovation in the circular construction sector?

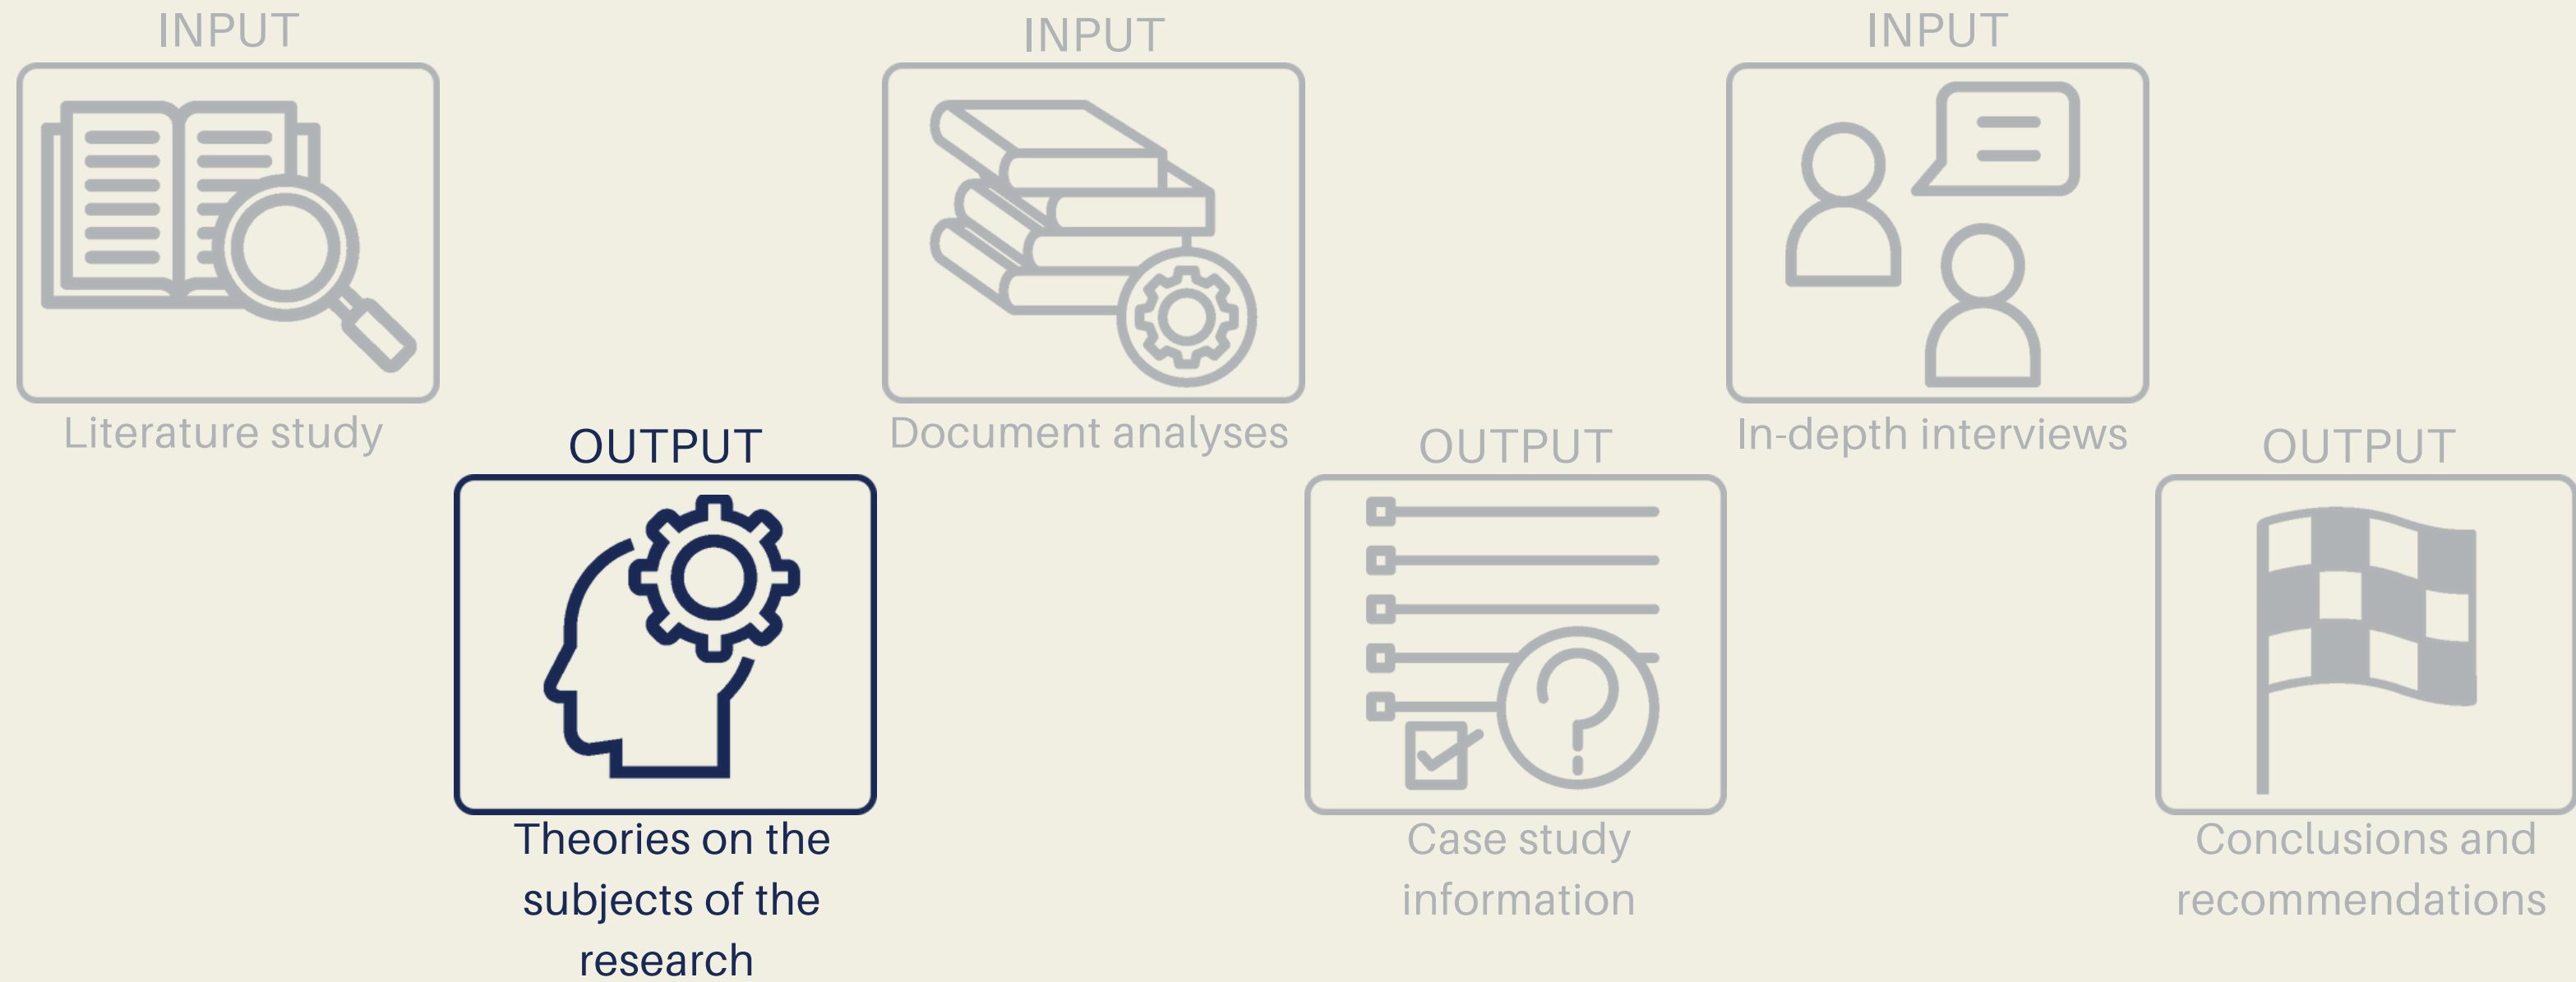

# Methods

# Literature review

# Literature review

What is the circular economy ?

- A world without waste
- Careful consideration of the next life of a product
- Keep products at their highest utility and value at all times

# Literature review

## Innovation

- Innovation occurs when different types of knowledge are converted into value.
- Product innovation is when a new good or quality of goods is introduced which an external user or market is not yet familiar with.
- Process innovation involves the implementation of new elements that have not been previously tried within a specific industry to manufacture a product or deliver a service.

# Literature review

## Collaboration

- Collaboration occurs when two or more stakeholders have a relationship together where they interact with shared rules, norms and structures. Stakeholders can include individuals, groups, organisations or entire societies.
- Inter-organisational collaborations arises when there are collaborations between different organisations.

# Literature review

Inter-organisational collaborations

# Literature review

Product life cycle (Levitt, 1965)

Market Development	Internal	We actually went through it step by step, calculating how much time it takes to pull these materials and analyze it's capacity to pull out that much of wood. So, in particular, when you're pulling out wood, in that way, we need to be able to set up a process. We brought out customers and engaged in discussions with them. We ended up with the idea of making great timber, thinking well, there can't be much wrong with it if it's a fraction of an inch thicker or thinner, right? Or if it has one extra pair of rings, nobody really cares. So that might be a real game to play, and that's when we began making great timber. (S)	We actually went through it step by step, calculating how much time it takes to pull these materials and analyze it's capacity to pull out that much of wood. So, in particular, when you're pulling out wood, in that way, we need to be able to set up a process. We brought out customers and engaged in discussions with them. We ended up with the idea of making great timber, thinking well, there can't be much wrong with it if it's a fraction of an inch thicker or thinner, right? Or if it has one extra pair of rings, nobody really cares. So that might be a real game to play, and that's when we began making great timber. (S)		So, just as I said, identifying three times, but continuing to do, and eventually writing all something that exists. We also had a lot of work to do, because in the beginning, everyone had their own idea of what they were going to do, so much time and energy in it that way. (S)		So, we did have those circular hubs, which are really the places where continuity is at its highest. You can see that the people working there are 100% committed. (S)		When that was up and running, three shipping containers quickly became two each, so we added two more shipping containers. (S)	Very much
	External		We closely examined with them what kind of products we should make, what quality standards to adhere to, when to expect something, and when to appear. It is the early stages, there was extensive communication about this, and you can see that it's more ongoing, ongoing. They are one of our customers, but not much more than that. (S)				For the first six months, I searched for someone who owned a sawmill and was willing to do this with us. So, I really learned from that. That when you're determining what to do, you're not sure if it can be done, but you're not sure that it's not completely done, often requires you to do it yourself. (S)		We worked closely with them to determine what kind of products to make, what quality standards to adhere to, when to expect something, and when to appear. It is the early stages, there was extensive communication about this, and you can see that it's more ongoing, ongoing. They are one of our customers, but not much more than that. (S)	Many
Growth	Internal	And eventually, it grew in such a way that I had more a fully custom woodworking shop in Utrecht, where we handle substantial volumes and produce high quality interior-grade finishing timber. (S)	And eventually, it grew in such a way that I had more a fully custom woodworking shop in Utrecht, where we handle substantial volumes and produce high quality interior-grade finishing timber. (S)		You're using wood while competing with large sawmills. In Constantine and Poland, but the wood prices here, of course, skyrocketed. So, we've been really lucky in that regard. (S)					Few
	External						But also when it comes to quality requirements, it's at the level of how many mill holes are allowed in a board space. There are things that people come up with on the way. I really need a partner that knows a lot about wood for these things, in collaboration to very important things. So, despite the fact that we were ultimately do it ourselves. (S)			Very few
Maturity	Internal				We handle the entire process in-house. And One major and jumped an actually our customers for almost all the construction materials we produce. That's very convenient for us because it means we don't have to maintain any inventory. I'm a bit allergic to holding inventory, so they come to pick up our products every week. (S)					
	External						Well, it really depends on the product. In essence, I don't need and don't want to buy any more woodworking equipment. This is different for my saw business, and it's different for our saw. It's a lot of fun, and very exciting project, and also there the whole morning today. It's not only to be there, and we were beautiful things. But I have about 10 material orders in the bank, and I get to get our own production location for all 10 of those material orders. One of course, I might have. (S)

Market Development	Internal	We actually went through it step by step, calculating how much time it takes to pull these nails and whether it's cheaper to pull out that piece of wood or to put something else in its place. So, we did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way.	We actually went through it step by step, calculating how much time it takes to pull these nails and whether it's cheaper to pull out that piece of wood or to put something else in its place. So, we did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way.		So, just as I said, something three times, but continuing to do, and eventually writing all something that exists. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way. We did not do it in a particularly efficient way.		So, we did have these circular tools, which are really the places where continuity is at its highest. You can see that the people working there are 100% committed.		When that was up and running, three shipping containers quickly became two each, so we added two more shipping containers.					
	External		We closely examined with them what kind of products we should make, what quality standards to adhere to, when to expect something, and when to appear. It is the early stages. There was extensive communication about this, and you can see that it was ongoing. They are one of our customers, but not much more than that.				It had that in months, I searched for some type of wood, a specific and was willing to talk with us. So, I really learned from that. The way you're communicating and working with us, willing to do it, but proving that it can't be done, that's really, and that's not completely correct, often requires you to do it yourself.		We worked closely with them to determine what kind of products to make, what quality standards to adhere to, when to expect something, and when to appear. It is the early stages. There was extensive communication about this, and you can see that it's ongoing. They are one of our customers, but not much more than that.					
Growth	Internal	And eventually, it grew in such a way that I now have a fully certified manufacturing plant in Utrecht, where we handle substantial volumes and produce high quality interior-grade flooring timber.	And eventually, it grew in such a way that I now have a fully certified manufacturing plant in Utrecht, where we handle substantial volumes and produce high quality interior-grade flooring timber.		You're using wood while competing with large amounts of construction and plastic. But the wood prices have, of course, skyrocketed. So, we've been really lucky in that regard.				When that was running, three shipping containers quickly became ten each. So we added two more shipping containers. And eventually, it grew in such a way that I now have a fully certified manufacturing plant in Utrecht, where we handle substantial volumes and produce high quality interior-grade flooring timber.					
	External						But also when it comes to quality requirements, it's at the level of how many nails there are allowed in a board space. There are things that people come up with on the way. I really need a partner that knows a lot about wood for these things, in collaboration with very important people. So, despite the fact that we are ultimately an IT business.							
Maturity	Internal				We handle the entire process in-house. And One major and jumped an actual customer for almost all the construction materials we produce. That's very convenient for us because it means we don't have to maintain any inventory. I'm a bit allergic to holding inventory, so they come to pick up our products every week.									
	External						Well, it really depends on the product, to be honest. I don't want and don't need to be very much committed to it. It's a different set of requirements, and it's different. Of course, it's a lot of fun, and very exciting. And I know that the whole morning today. It's not only for the time, and we're very beautiful things. But I have about 10 material orders in the bank, and I can't get all our own production location for all 10 of those material orders. That's a really, really hard job.							
Decline	Internal						I established that wanted more to prove that it's possible, and I hope that someone will eventually pick it up and say, "Yes, bring your wood here because I can do it much better and more efficiently than you." That way, I can finally get rid of it.

	Product	Process	Product	Process	Product	Process	Product	Process	Product	Process
Market Development	Internal	<p>The first commercial step of ours where a donor mission was used, and, of course, several people have been used in collaborations before, but this is on a larger scale and also a material that came from a completely different context. You use the same thing in similar projects or renovations. You have used being involved in the building. Well, then you can say, I can place a renovation, one and reuse it. So that might have happened, but truly the concept of having an owner (renewing, long or standing) come when and using them to completely different building, that's new in this project (IM).</p> <p>So, completely revised, you name it. So, I said, "Well, maybe we can do something with these. We had them examined in drawings which kind of profiles were there, how much length they had. So, we examined in drawings and actually gave to Bostan and went to the construction site ourselves. We had about 80% of what we could reuse in the design. They wanted to get the client on board, so we said, "We have 80%, and if you're interested, we need to negotiate with these parties on how to do it together, so all over your time and, "You should do that together with the contractor." Because the contractor had already been selected, so we did that with the contractor.</p> <p>The interesting part was that the client said, "I'm actually a bit disappointed that you don't have 100% of being looking. The assessment as to find some more to reuse. We regulated the design not at the location but on the profile of it. So, we immediately understood that, right, it shows that in the design process, you need to make adjustments.</p> <p>Last but not least, we've written a comprehensive procedure protocol on how to handle the material's quality (IM).</p>	<p>We had a material investigation done in collaboration with the client. We also created an inspection table to determine the best quality and formation, dimensions, and various other factors.</p> <p>A company conducted this material analysis for (IM).</p>	<p>At one point, we sat down with a demolition company and had them do a drawing just to check if demolition, and they also had a history with the owner. So they said, "You probably..."</p> <p>So, like I mentioned when we started with renovation, they weren't really focused on this aspect at all back then. That was about 10 years ago or so, 8 years ago. They didn't think about it at all. Now, they have actually established a company specifically focused on this. So, you can see how the market has changed over time and it's not only us. So, the demolition company searched for these profiles for two years but couldn't find them. So, I thought, "Well, that's a shame." That's when we started searching ourselves and came across a demolition company where the materials were just lying in a field. Now, it's common for other parties, including the first demolition company, to call us and say, "They, we have this and that, and we're going to remove it. Can you use it (IM)?"</p>	<p>Yes, the breakthrough of the project came because we took the initiative ourselves. So, when it comes to renovations, the party that starts, that has the passion for it, really has to take the lead and go all in (IM).</p> <p>Yes, the breakthrough of the project came because we took the initiative ourselves. So, in the case of renovations, the party that starts, that has the passion for it, really has to take the lead and go all in (IM).</p>	<p>No, for each project we were running at that time, we had to figure out the best way, just if that takes time and effort (IM).</p>				
	External	<p>Because with that number of parties, you're more going to be able to focus on anything. Because everyone has their own capabilities and personal opportunities, risks, and if you start putting them together, then opportunities get smaller and risks get bigger. I also didn't put CB 23 because I was the one, I am a structural engineer, I kept in touch with construction and I didn't deal with insurance terms and that's a waste for me because I don't know anything about that.</p> <p>To create profiles for the construction and then to collaborate with those authorities to figure out how to make a complete with regulations. Because, of course, regulations are primarily based on new materials, at least at that time and length with time. So, given that it needs all this, the whole circular aspect must be included in, with us, the building code and other regulations. How to address that? (IM)</p>	<p>The municipality didn't play a very significant role. However, we collaborated with the municipality on the quality control procedure and calculation system. In renovations, you naturally encounter regulations, and building regulations and know where something is, but when it's existing or reuse we didn't have regulations for it. The municipality is responsible for the calculation, and we are responsible for the calculation. The contractor is responsible for the execution, ensuring it's done correctly, and ultimately, for the quality of the steel because they took their own time when it was in the contract. The municipality then has to say, "Okay, it's approved, and you will get a permit later (IM)."</p>	<p>The municipality didn't play a very significant role. However, we collaborated with the municipality on the quality control procedure and calculation system. In renovations, you naturally encounter regulations, and building regulations are known when something is new. But when it's existing or reuse, we didn't have regulations for it. We discussed this with the municipality because they ultimately have to give their approval, and we are responsible for the calculation. The contractor is responsible for the execution, ensuring it's done correctly, and ultimately, for the quality of the steel because they took their own time when it was in the contract. The municipality then has to say, "Okay, it's approved, and you will get a permit later (IM)."</p>	<p>You can see that clients want it, but they also had like a lot to be determined in a certain way, perhaps from above, like a decision made by the municipality, province, or some other party. However, sometimes the ones who have the responsibility aren't necessarily particularly motivated about the topic, and that does affect the motivation for cooperation from the client's side (IM).</p> <p>When it comes to collaboration on circularity in the projects where, for example, we don't just do our skeletons, we find that all parties must fully support and embrace the principle. This means that both the client, the architect, the supplier, and the main contractor must be on board. We, of course, stand behind it, as we often discuss it as well. But everyone needs to embrace it (IM).</p>	<p>Similar projects during this project, because as a project that has had a long duration. But during the project, we've already encountered other works where we used glass windows and round constructions (IM).</p>				
Growth	Internal	<p>Based on our current projects, we have used based a workflow for how to do it, how it can be done. What you can see from that is, if you have a building that's already there and you're going to decommission it, and then use it for a new building, it has a very high chance of success because you already know everything about it. You know the design, and you don't need to do the design here because you already have the basis for your design (IM).</p>	<p>That's one aspect, and ensuring regulations. So, I am also. This year, the first standard for the reuse of steel elements is being launched. Dutch technical agreements have been established between the Ministry of the Interior and the steel construction industry, and they are set to be launched in June (IM).</p>	<p>Yes, it's about more sustainable concrete, right? No, they have already been involved in several other projects. Nevertheless, whenever steel hasn't made it mandatory yet. So, it may still need some attention, but we're already on the way. In the end, ensuring circularity and providing the right circular criteria that can make such a project a success (IM).</p>	<p>The interesting thing is that almost all the parties have started doing something with it. We actually approached the demolition company, which usually had nothing and became an essential element. This even created a circular demolition company. We asked "helped" to do this, and they got involved about it. They are now taking steps to make more reused material possible. It's quite unique to see that both companies are doing this because they see a business model in it (IM).</p>	<p>That's one aspect, and ensuring regulations. So, I am also. Stages Life Cycle	Characteristics Collaborations	Level of Specificity		Level of Uncertainty		Level of Trust & Commitment		Time Frame			
		Product	Process	Product	Process	Product	Process	Product	Process		
Market Development	Internal	The first commercial step of ours where a donor measures was used, and, of course, several small test were used in construction before, but this is on a large scale and also a material that came from a completely different context. You use the same thing in smaller projects or renovations. You have used things used in the building. Well, then you can say, I can place a somewhere else and reuse it. So that might have happened, but truly the concept of having an element, reusing, long or creating something where and using them in completely different building, that's new to the project (IM4).	So, completely reused, you name it. So, I said, "Well, maybe we can do something with these, we had them measured in dimensions which kind of profiles were there, how much length they had. So, we measured in dimensions and they actually gave to Boveri and went to the construction site ourselves. We had about 80% of what we could reuse in the design. They wanted to get the client on board, so we said, "Well, here 80%, and if you're interested, we need to negotiate with these parties on how to do it together, so at one point that can, you should do that together with the contractor. Because the contractor had already been selected, so we did that with the contractor.	The interesting part was that the client said, "I'm actually a bit disappointed that you don't have 100% of the things. You required the design not at the location but on the profiles and that, we immediately understood that 100%, it shows that in the design process, you need to make adjustments.	At one point, we sat down with a demolition company and had them to have a strategy but a bit of demolition, and they also had a history with the courts. So they said, "The problem..."	Yes, the breakthrough of the project came because we took the initiative ourselves. So, when it comes to renovations, the party that starts, that has the passion for it, really has to take the lead and go all in (IM4).	Yes, the breakthrough of the project came because we took the initiative ourselves. So, in the state of renovation, the party that starts, that has the passion for it, really has to take the lead and go all in (IM4).	No, for each project we were running at that time, we had to figure out the best way, just if that takes time and effort (IM4).			
	External	We had a material investigation done in consultation with the client. We also created an inspection table to determine the best quality and materials, dimensions, and various other factors.	We had a material investigation done in consultation with the client. We also created an inspection table to determine the best quality and materials, dimensions, and various other factors.								
Growth	Internal	It started with the client, but the process, it was more people in their own capabilities and expertise, and they got together, got together, and they got together. I was also part of it because I was the one, I am a structural engineer, I spent a lot of time with construction and design. I had some similar projects and had a space for me because I don't know anything about it.	Based on our current projects, we have used based a workflow for how to do it, how it can be done. What you can see from that, if you have a building that's already there and you're going to decommission it, and then use it for a new building, it has a very high chance of success because you already know everything about it, you know the designs, and you don't need to do the design from scratch, you already have the basis for your design (IM4).

Stages Life Cycle	Characteristics Collaborations	Level of Specificity		Level of Uncertainty		Level of Trust & Commitment		Time Frame		
		Product	Process	Product	Process	Product	Process	Product	Process	
Market Development	Internal	Because it requires a lot of work for them, it's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.	Yeah, for sure it requires the collaboration of different professionals, which is always messy. But all these professionals they need to be able to work together. There are some people who are different of those ones or more of those ones. For example, an architect and a designer. And we talk about cost, designer and architect. It's always messy. And we go back to the client. So there we have a client which is the responsibility of the client. And we go back to the client. So there we have a client which is the responsibility of the client. And we go back to the client. So there we have a client which is the responsibility of the client.		So we delivered a flexible temporary design. They are going to have about this amount of work. We don't know exactly which stage we don't know. But the thinking part and then later we update the permit. And we do, one of the things that we are going to do is that we update the permit. And we do, one of the things that we are going to do is that we update the permit.		What is really interesting of this project is that they don't know what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.		So we delivered a flexible temporary design. They are going to have about this amount of work. We don't know exactly which stage we don't know. But the thinking part and then later we update the permit. And we do, one of the things that we are going to do is that we update the permit. And we do, one of the things that we are going to do is that we update the permit.	
	External	During the demolition, the Demolisher was there. The thing of being back and forth, so we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing.		I don't know if you have a question more in the design. The thing of being back and forth, so we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing. And we start to cut the columns that we are demolishing.		But I think an easier collaboration between all the parties. I mentioned before, I will put also the responsibility, the governance. It's more a responsibility in the way of the circular economy. Collaboration is fundamental in the building phase. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.				
Growth	Internal	So we already know what they want. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.	There is a path to it. It's complicated. You know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know.		And there is no consensus between the parties. The people who are going to build it, they are not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.		What is really interesting of this project is that they don't know what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.		So we delivered a flexible temporary design. They are going to have about this amount of work. We don't know exactly which stage we don't know. But the thinking part and then later we update the permit. And we do, one of the things that we are going to do is that we update the permit. And we do, one of the things that we are going to do is that we update the permit.	
	External	There is a path to it. It's complicated. You know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know. I don't know what I don't know.		And there is no consensus between the parties. The people who are going to build it, they are not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality.		What is really interesting of this project is that they don't know what they want. But if you ask them professionally they require a lot of work for the party. They will expect a high quality. It's not always clear what they want. We had to build upon our experience with them. We had to build upon our experience with them.			
	External	The first commercial step of our where a clear idea from our customer was used, and, of course, we had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them.	So, completely correct, you can't do it. I can't. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them.	At this point we still deal with a dominant company and find that we have a competing bid. So, we had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them.	The breakthrough of the project came for us when we had a meeting with the client. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them.	So, the breakthrough of the project came for us when we had a meeting with the client. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them. We had to build upon our experience with them.
