Main tutor: Thomas Offermans  
Research tutor: Jos de Krieger  
BT tutor: Gilbert Koskamp

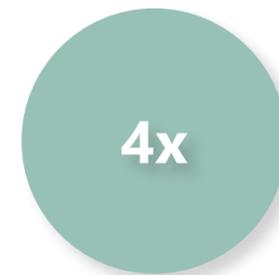

Over Coal powered plants in EU

Total Greenhouse emissions of EU came from burning coal

The health costs of coal

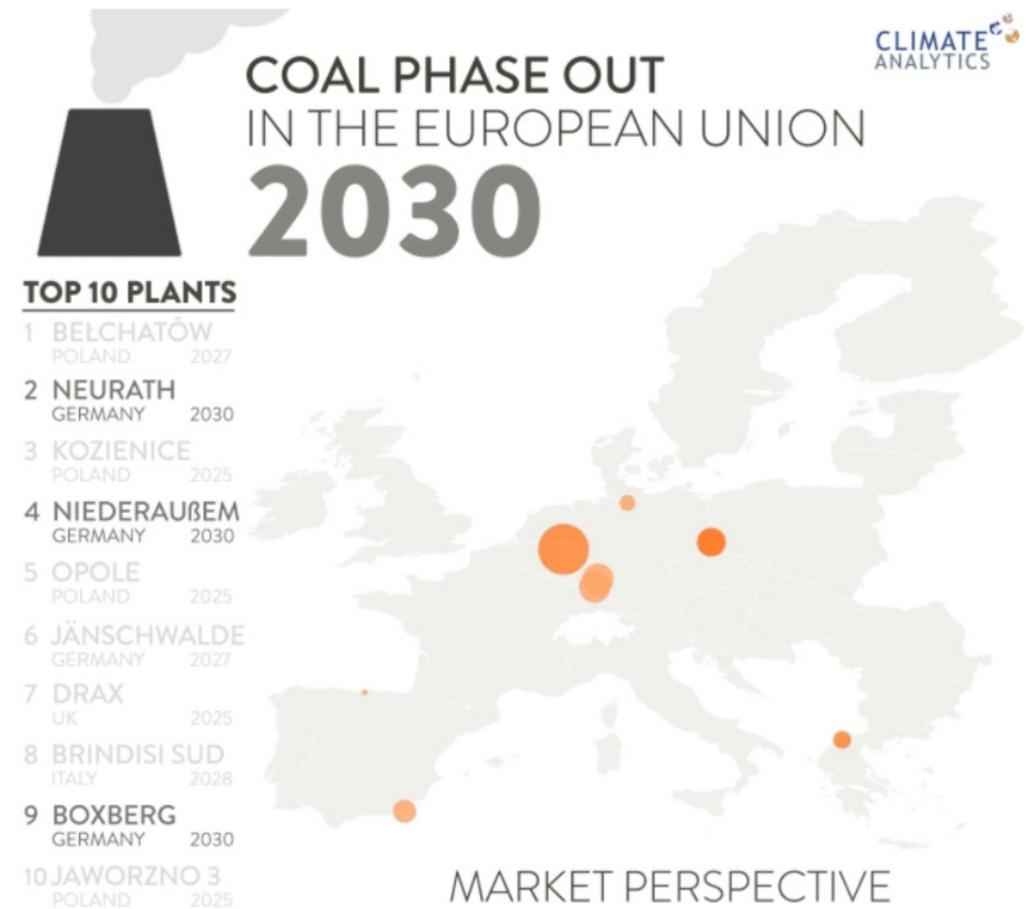

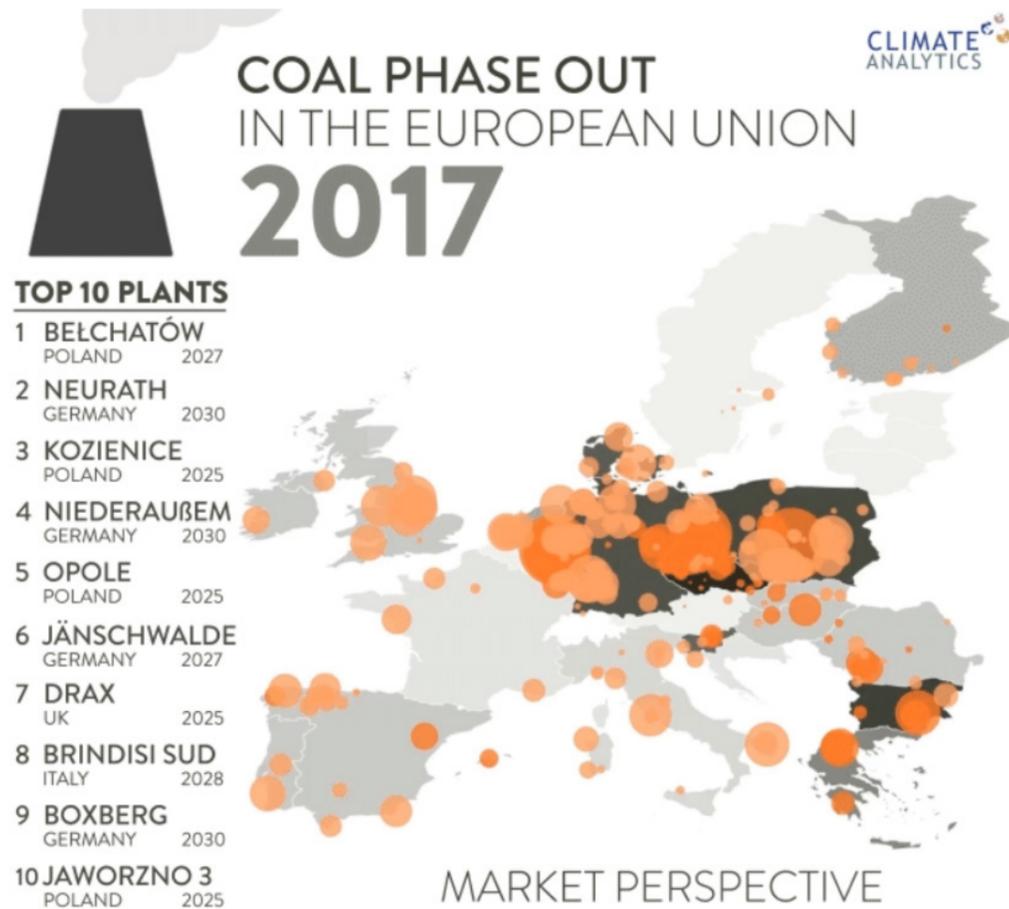

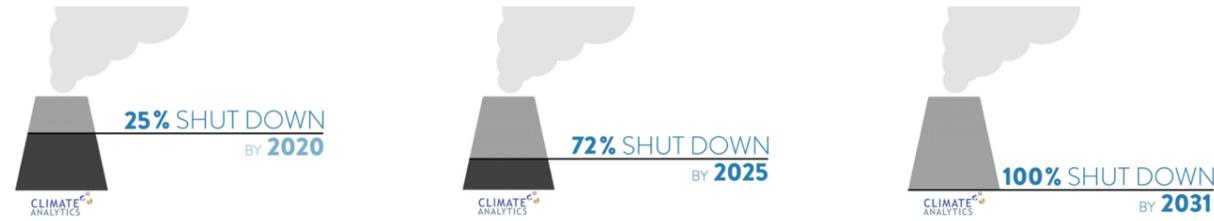

Employment in renewables

EU's phase out plans

Source: CanEurope.org

Under the Paris agreement, coal power plants are being decommissioned in EU to reduce carbon emissions. In the next few decades defunct thermal power plants are going to pop-up all over EU.

In the next decades, around 300 power plants across EU are going to close.

Objective: To re-purpose vacant industrial landscapes(thermal power plants) to integrate them within the expanding city and create a multi-cultural hot-spot promoting circular and sustainable future.

**SUSTAINABLE DEVELOPMENT GOALS**

Coal power plants can act as protagonist in achieving these sustainable development goals (SDG) by 2030.

How does the refurbishment of vacant thermal plants using existing structures and materials on site promote sustainability and circularity in a social way?

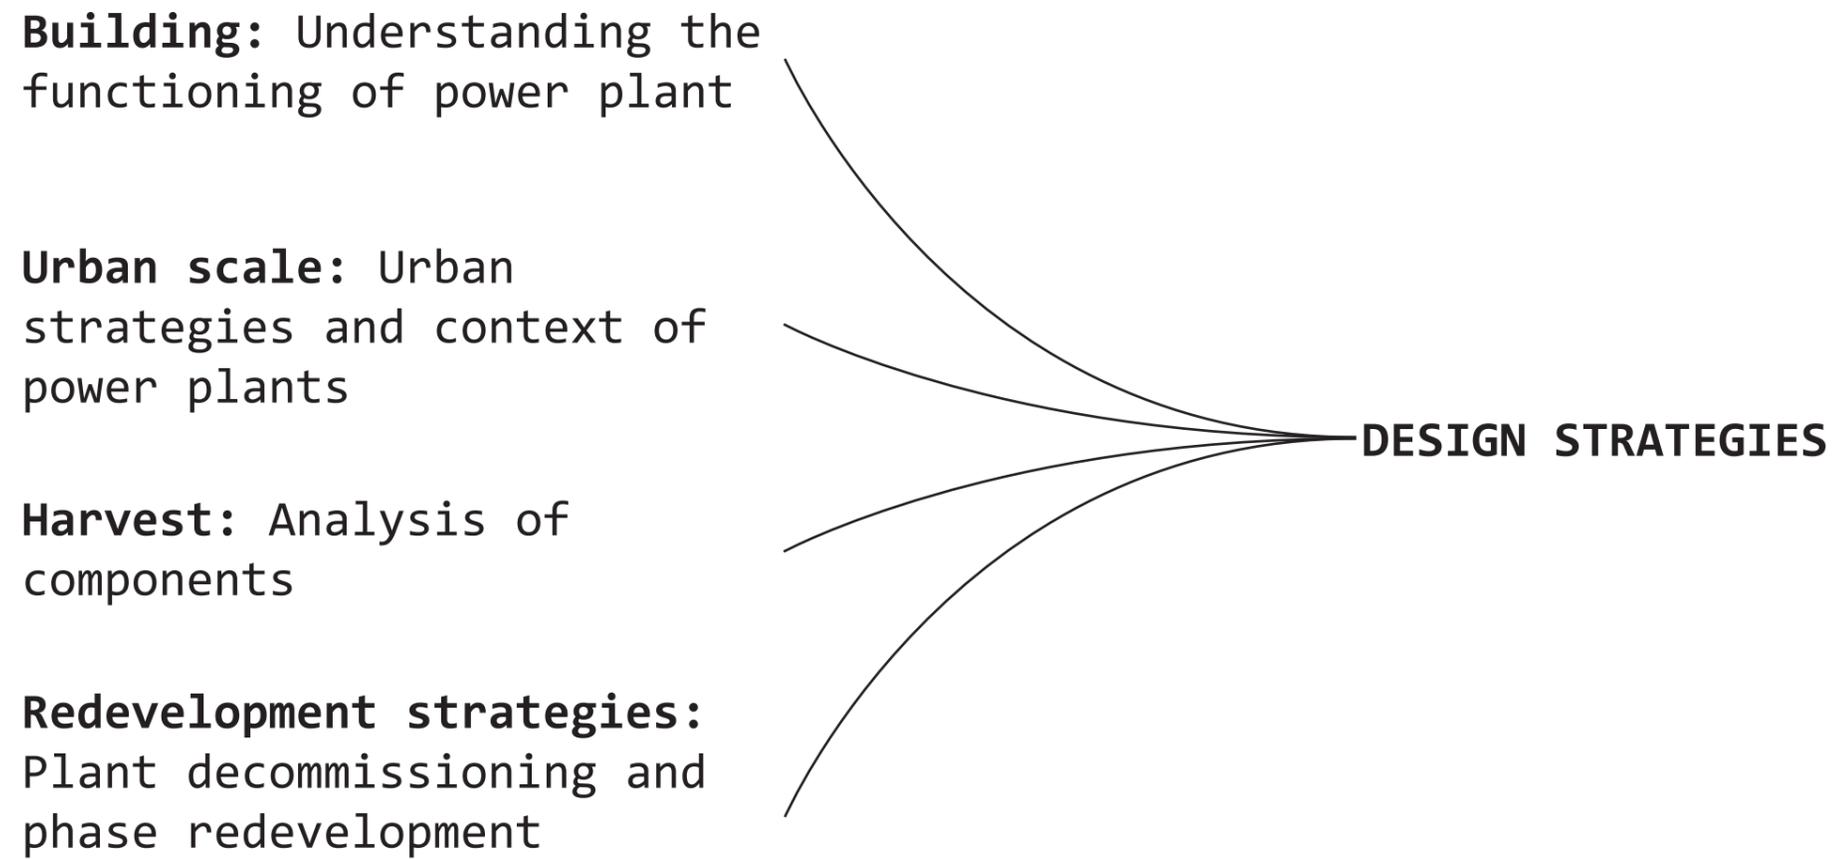

**Building:** Understanding the functioning of power plant

**Urban scale:** Urban strategies and context of power plants

**Harvest:** Analysis of components

**Redevelopment strategies:** Plant decommissioning and phase redevelopment

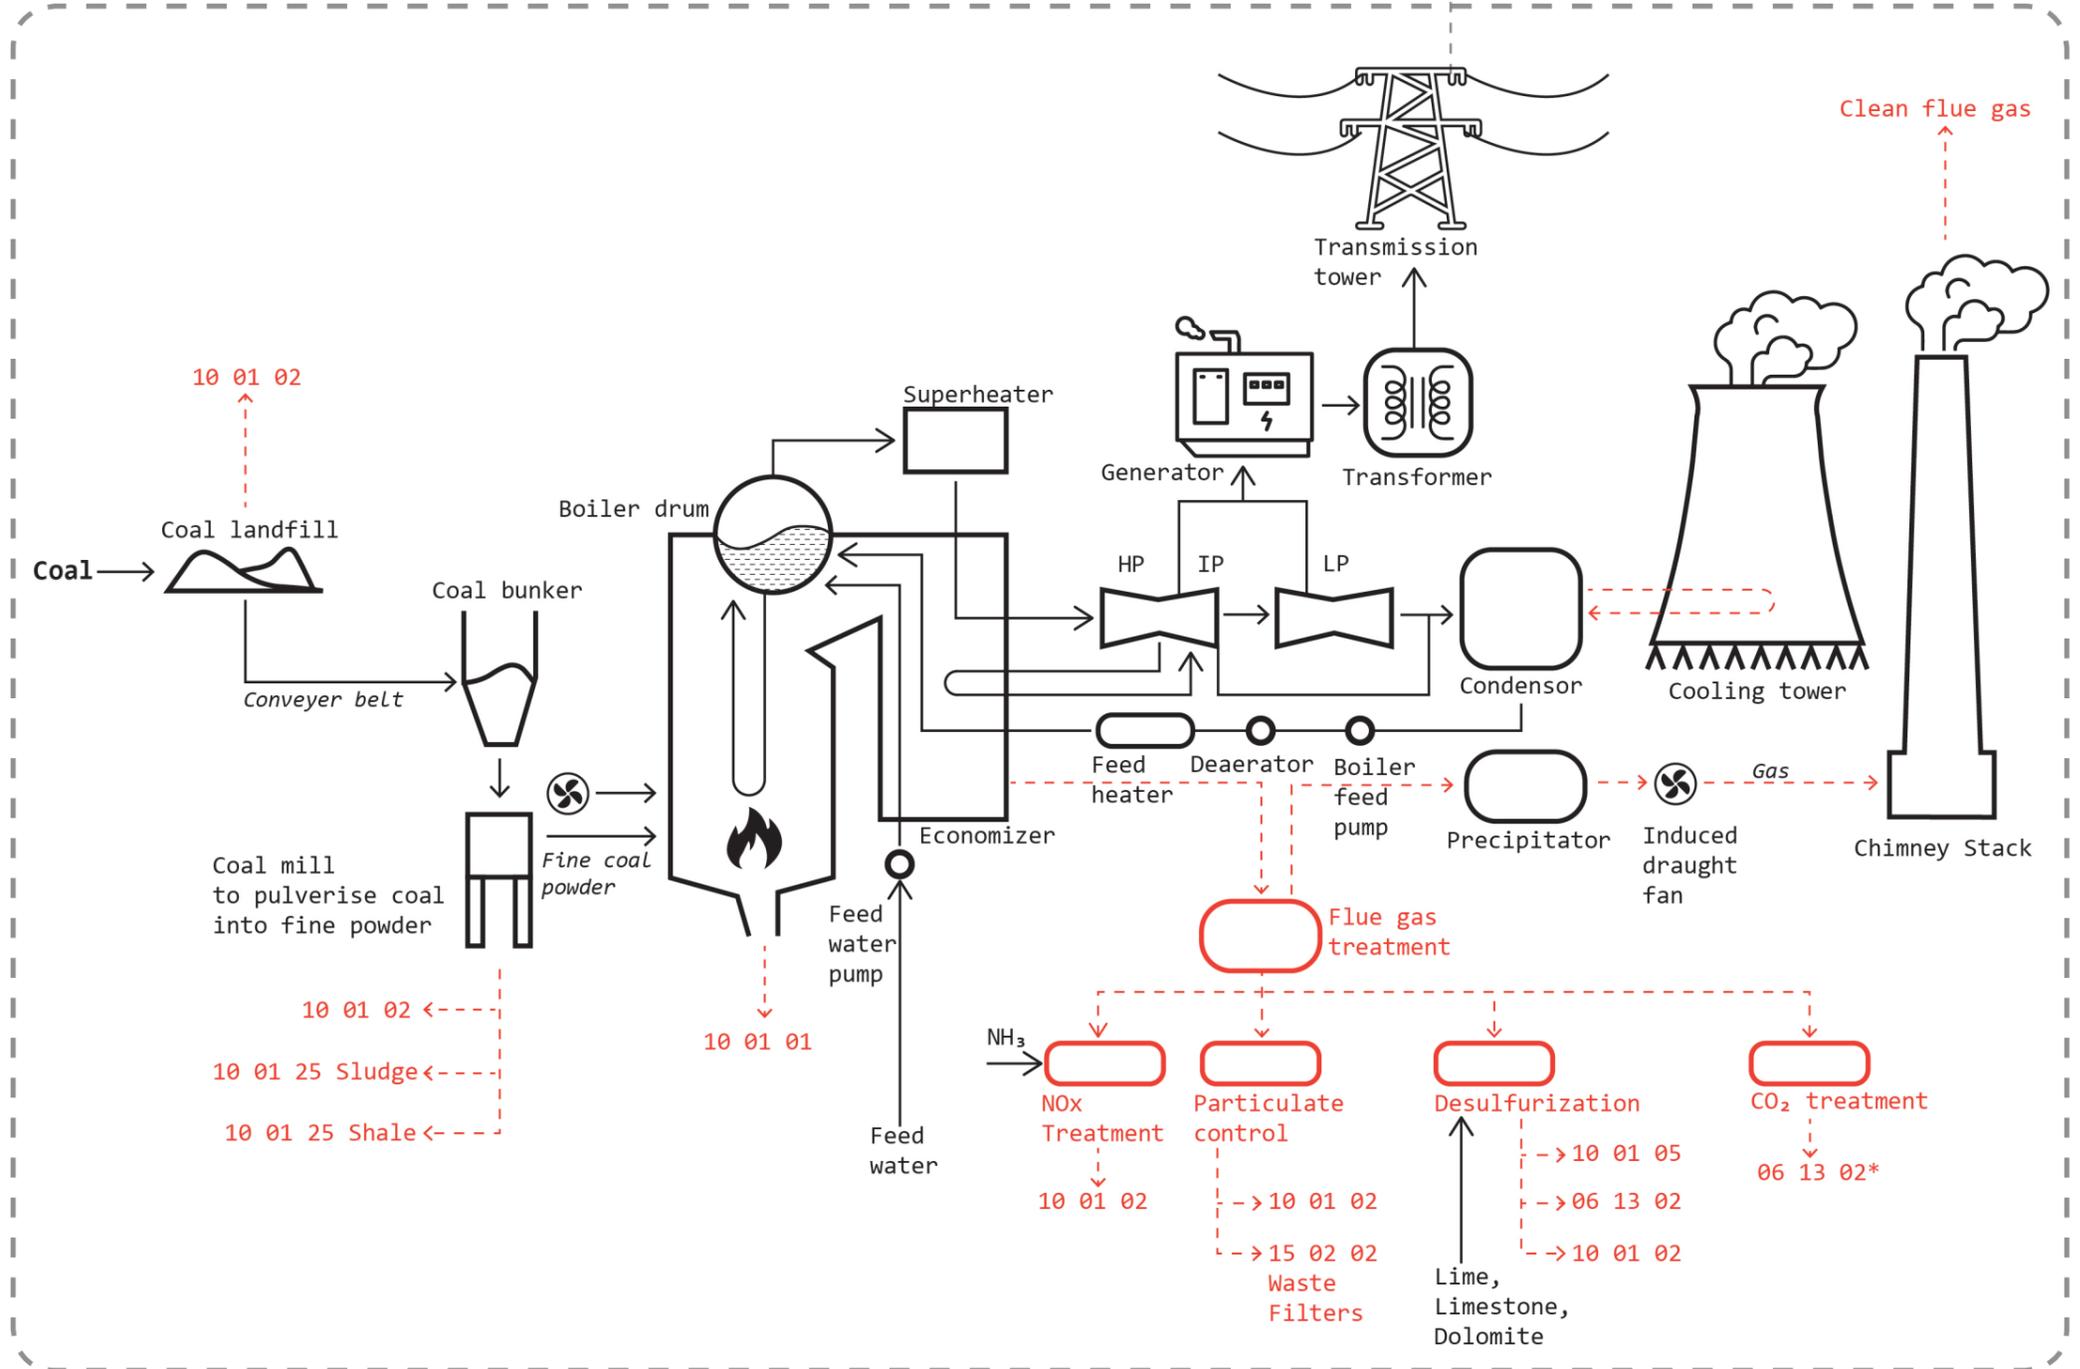

**DESIGN STRATEGIES**

# BUILDING SCALE

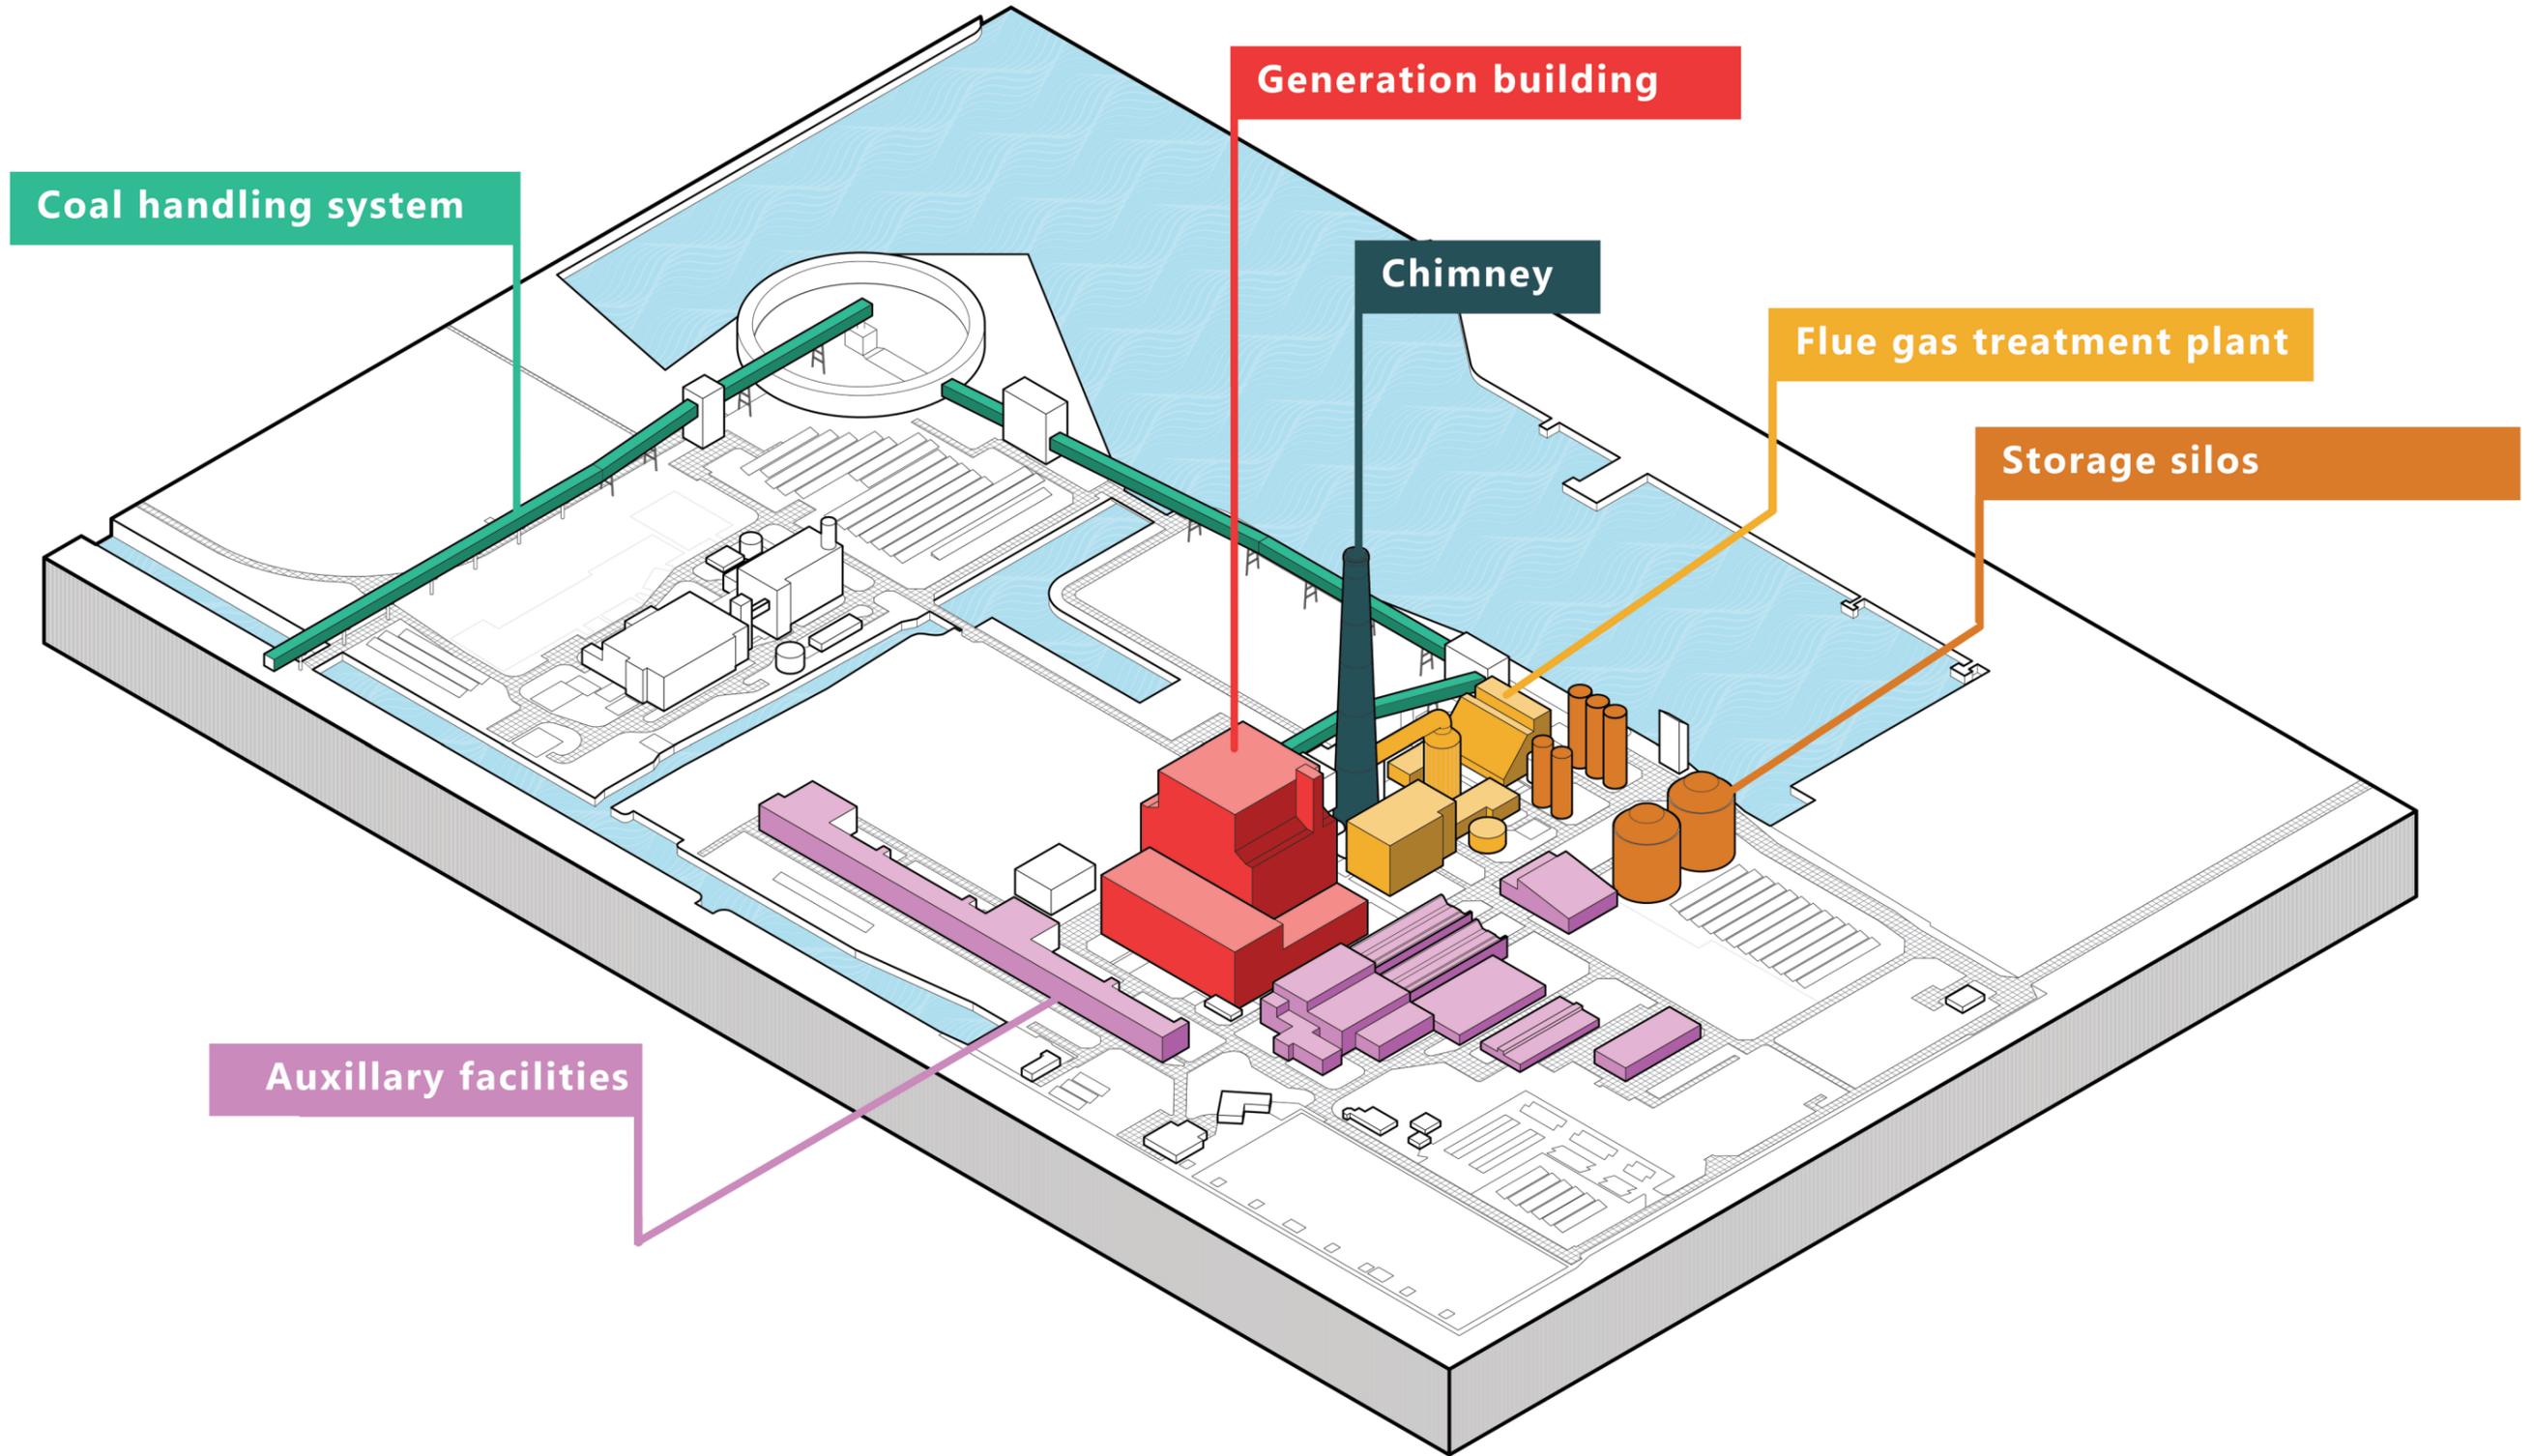

What is the general functioning flow of coal power plants?  
 How are the spaces utilized and what is the composition of the machinery, instruments and structure? What are the environmental impacts of coal utilization on the ecosystem (constraints upto site boundaries)?

Understanding the functioning of coal powered plant is crucial in revealing the possibilities and reusing the site or building. It provides a better understanding of the various components, building, planning and structure which is vital information for the sections to follow.

## Raw Material Extraction > Processing > Transport > Power Plant > Transmission

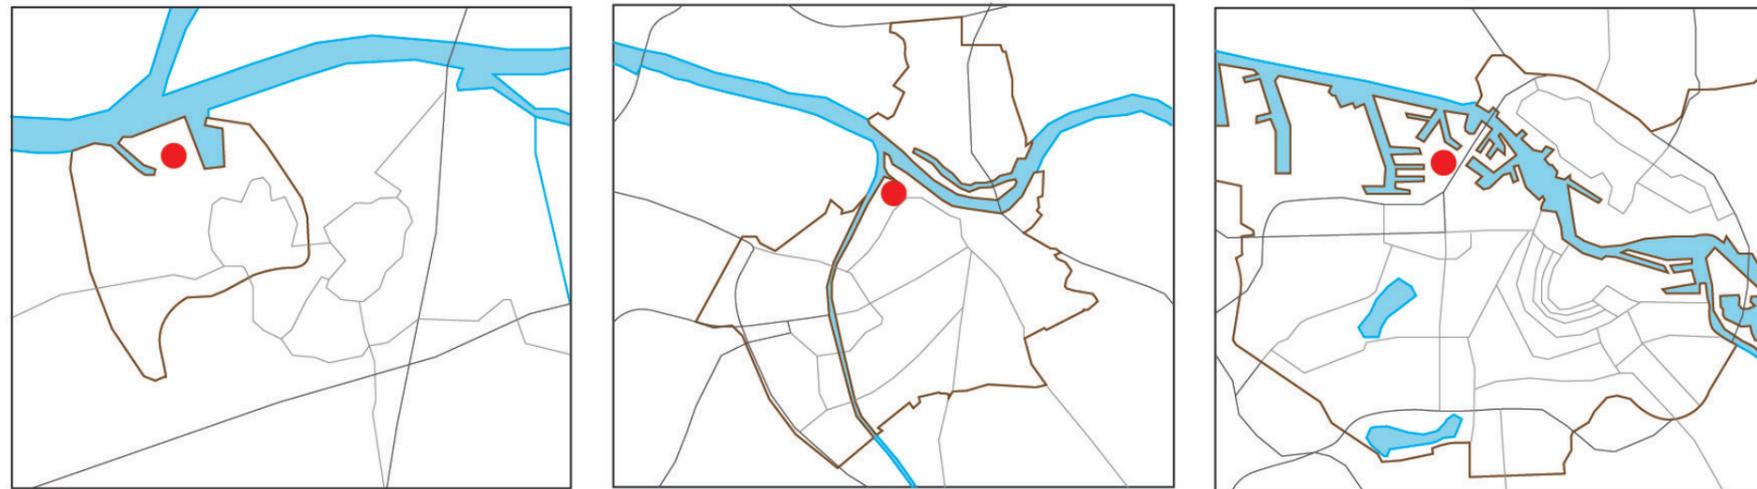

Schematic diagram of the functioning of coal power plant and waste points.

Major agglomerations of facilities on site

Where are the coal power plants situated and what is the context?

It help reflect the potential reuse opportunities, program ideas and provide a better understanding of the urban contexts of coal power plants to incorporate them in the design.

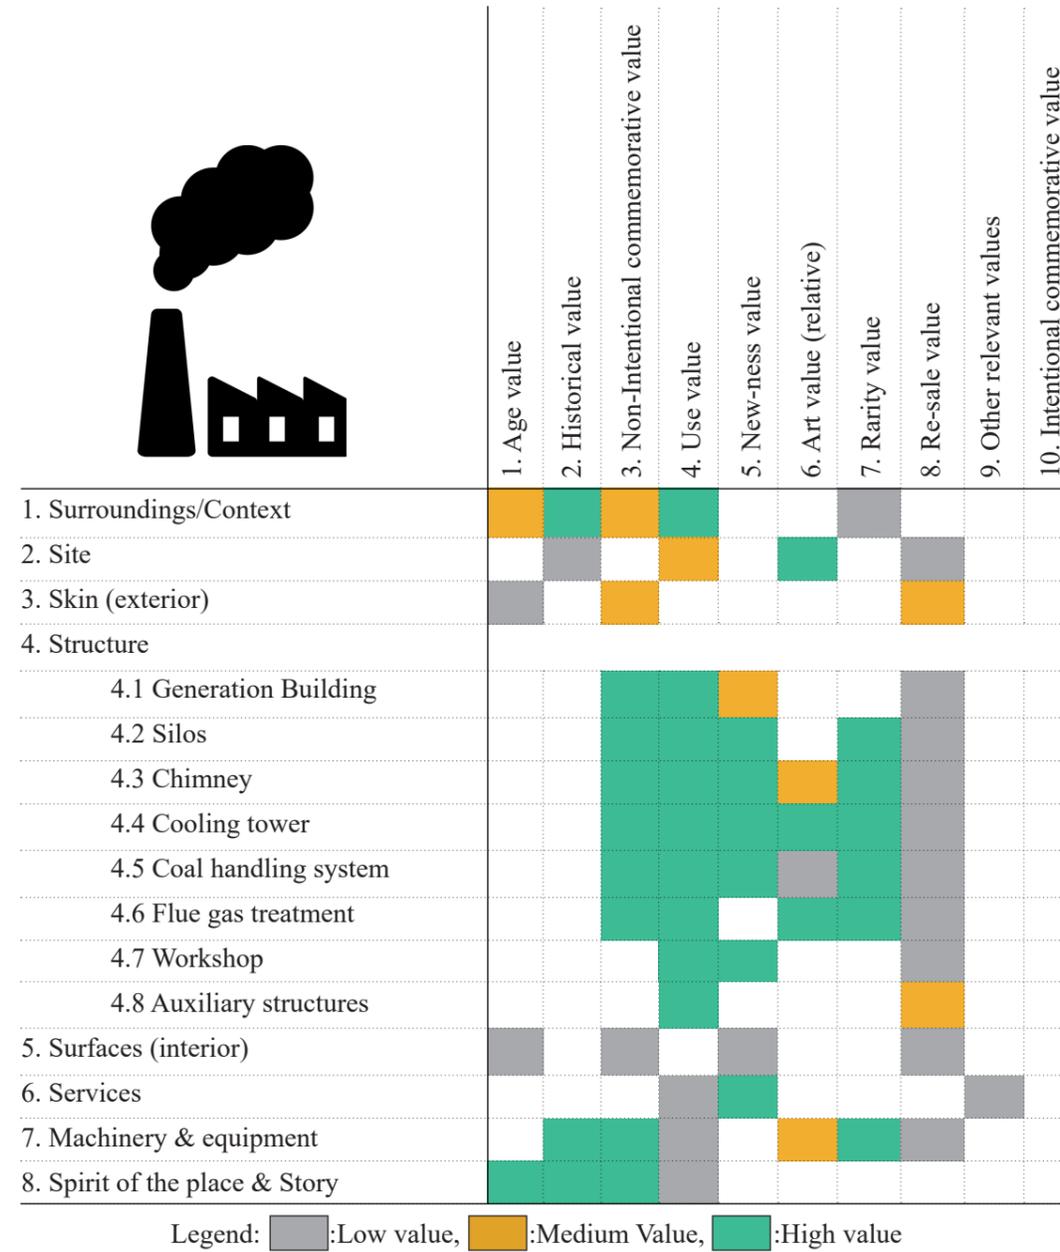

Schematic diagram of coal power plants in Nijmegen, Geertruidenberg and Amsterdam marking the location of power plants in respect to cities. (The diagrams are not relatively scaled.)

The site chosen for intervention is Vattenfall coal power plant in Amsterdam is the site chosen as primary source and design site. The coal power plant in Amsterdam is close to the harbour, industrial area, Sloterdijk and Havenstad.

How can we harvest from industrial landscapes? Which existing conditions on site should be reused/recycled/repurposed and why?

Assessment is beneficial for the designer in decisions regarding intervention, like re-use/demolition/conservation.

# HERITAGE VALUE MATRIX

	1. Age value	2. Historical value	3. Non-Intentional commemorative value	4. Use value	5. New-ness value	6. Art value (relative)	7. Rarity value	8. Re-sale value	9. Other relevant values	10. Intentional commemorative value
1. Surroundings/Context	Medium	High	Medium	High			Low			
2. Site		Low	Medium	Medium		High		Low		
3. Skin (exterior)	Low		Medium					Medium		
4. Structure										
4.1 Generation Building			High	High	Medium			Low		
4.2 Silos			High	High		High	Low			
4.3 Chimney			High	High		Medium	High			
4.4 Cooling tower			High	High		High	High			
4.5 Coal handling system			High	High		Low	High			
4.6 Flue gas treatment			High	High		High	High			
4.7 Workshop			High	High		High	High			
4.8 Auxiliary structures			High	High				Medium		
5. Surfaces (interior)	Low		Low		Low			Low		
6. Services					High				Low	
7. Machinery & equipment		High	High	Low		Medium	High	Low		
8. Spirit of the place & Story	High	High	High	Low						

Legend:  :Low value,  :Medium Value,  :High value

2	Age Value	Historical Value	Non-Intentional commemorative value	Use value
Site		Relation to water, harbour and city.		Large plot: sites have big plots and ample empty space.
	Newness value	Art value	Rarity value	Resale value
		Agglomeration of unique objects		Site has low re-sale value due to finances involved in decommissioning.

# HERITAGE VALUE MATRIX

	1. Age value	2. Historical value	3. Non-Intentional commemorative value	4. Use value	5. New-ness value	6. Art value (relative)	7. Rarity value	8. Re-sale value	9. Other relevant values	10. Intentional commemorative value
1. Surroundings/Context	Medium	High	Medium	High						
2. Site		Low		Medium		High				
3. Skin (exterior)			Medium					Medium		
4. Structure										
4.1 Generation Building			High		Medium					
4.2 Silos			High			High				
4.3 Chimney			High			Medium				
4.4 Cooling tower			High			High				
4.5 Coal handling system			High			Low				
4.6 Flue gas treatment			High			High				
4.7 Workshop			High	High						
4.8 Auxiliary structures			High					Medium		
5. Surfaces (interior)	Low		Low		Low			Low		
6. Services				Low	High				Low	
7. Machinery & equipment		High	High	Low		Medium	High	Low		
8. Spirit of the place & Story	High	High	High	Low		Medium			Low	

Legend:  :Low value,  :Medium Value,  :High value

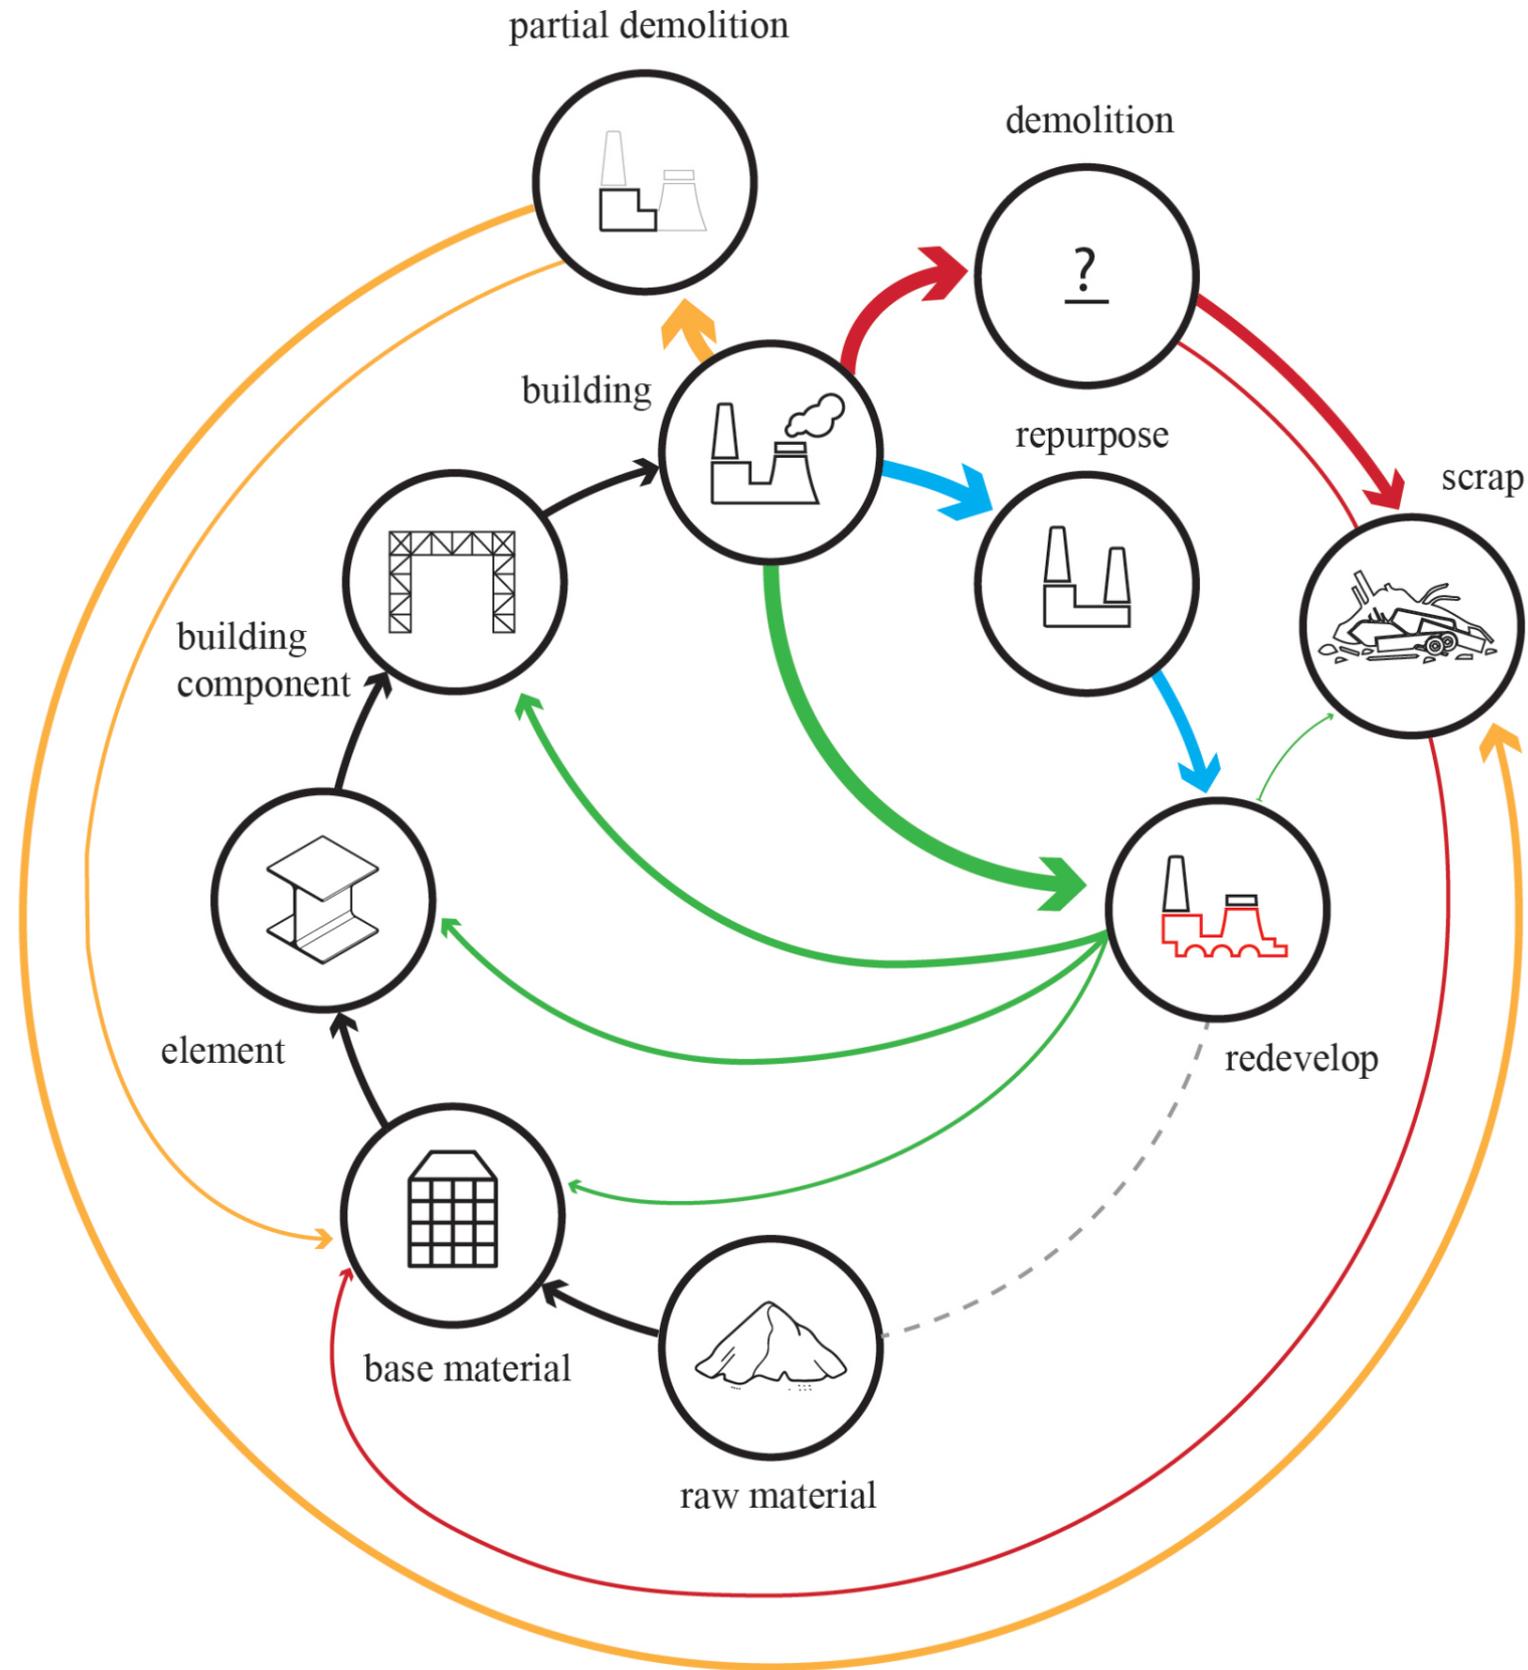

14	Age Value	Historical Value	Non-Intentional commemorative value	Use value
Machinery & equipment		Embody scientific and technological development.	Organs of the industry.	No functionality post-decommissioning
	Newness value	Art value (relative)	Rarity value	Resale value
Machinery & equipment		Aesthetically pleasing in their own way.	Customized to the industry and plant.	Except a handful machines most have scrap value.

# REDEVELOPMENT STRATEGIES

What are the reuse opportunities for these sites? How can the rejuvenation of industrial plant bring added value on a neighborhood scale in contributing to sustainable development goal?

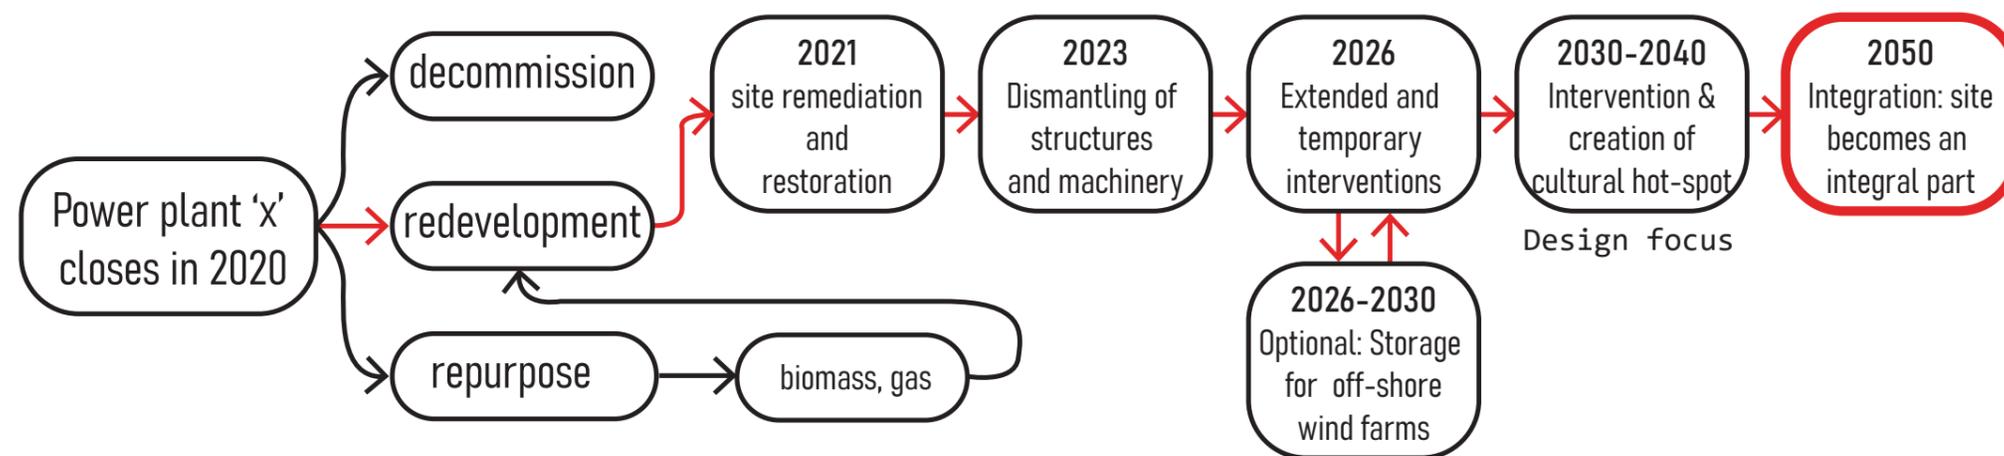

Various methods of re-purposing the power plants. Possibilities of integrating industrial landscapes within the expanding cities.

# REDEVELOPMENT PHASE TIMELINE

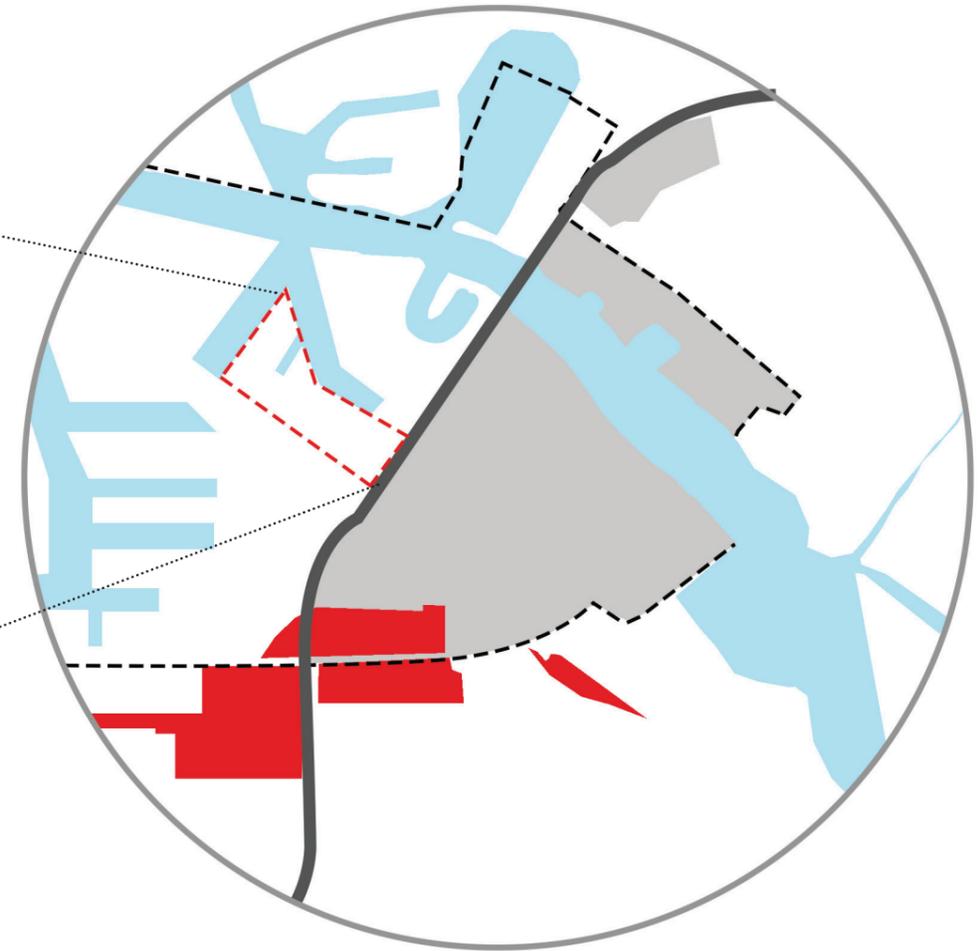

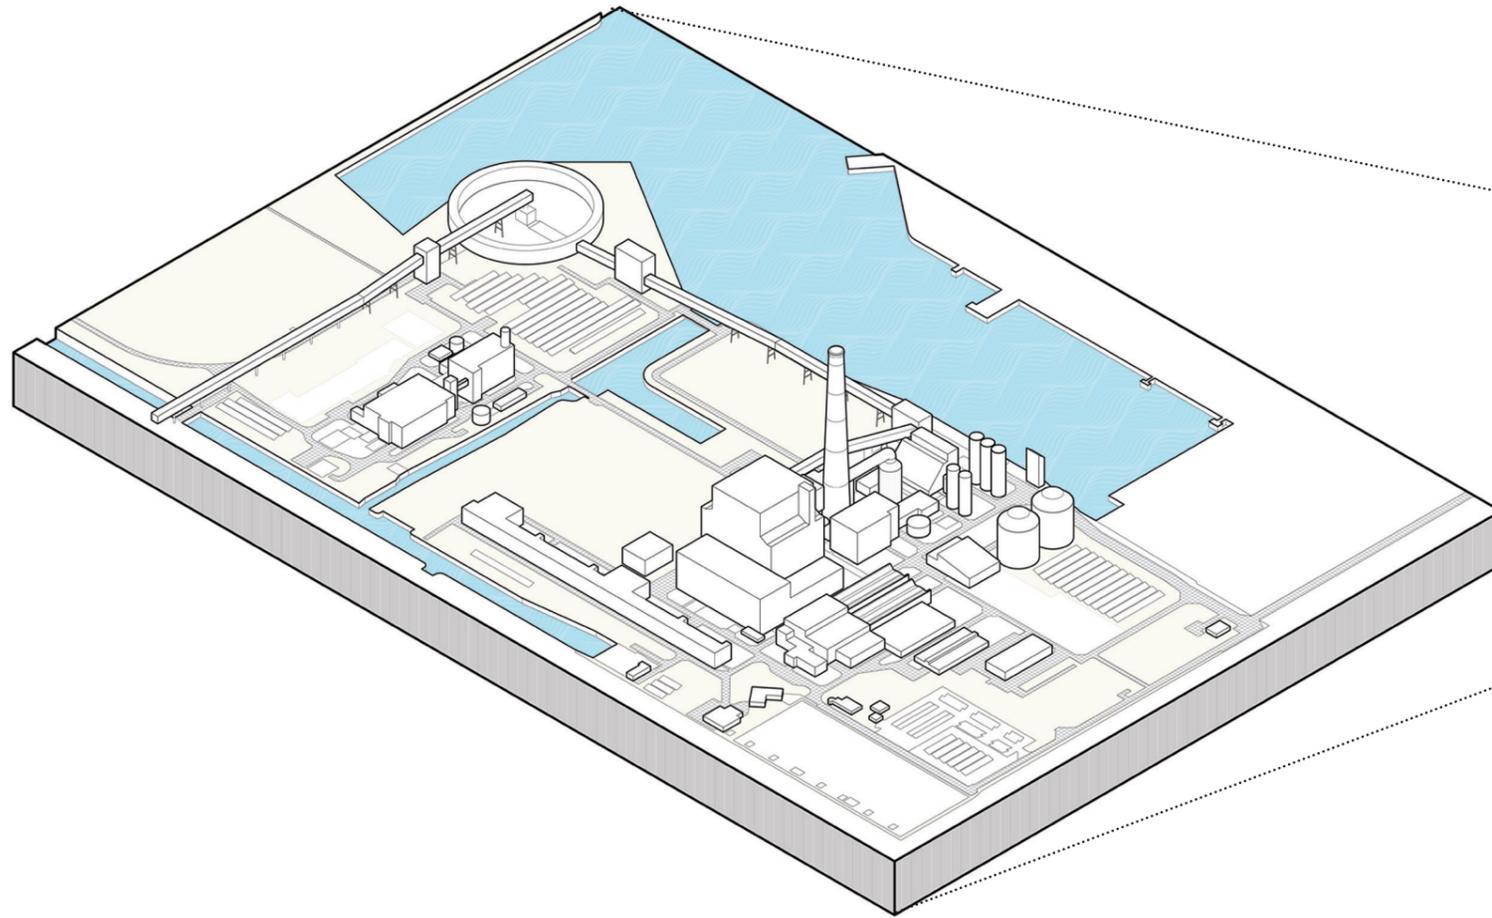

Creating a time-line of redevelopment for a power plant from the above-mentioned strategies. Assuming a coal-power plant 'x' closes in the year 2020. It would be faced with 3 viable strategies. Adopting the 'Planned reuse' redevelopment strategy for a power plant considering a close collaboration between the owner, state government and public organization; a stepwise elaborated strategy is illustrated in the diagram.

2018-2019

>2018a:  
Locations

Sloterdijk Centrum,  
Sloterdijk I- Zuid,  
Zaanstraat Emplacement.

**Remediation** and cleaning of site from contamination.

**Removal** of Unwanted Structures.

**Planning** of future re-use strategies.

1.800.000 m2 total BVO

14.800 homes

614.000 m2 BVO non-residential

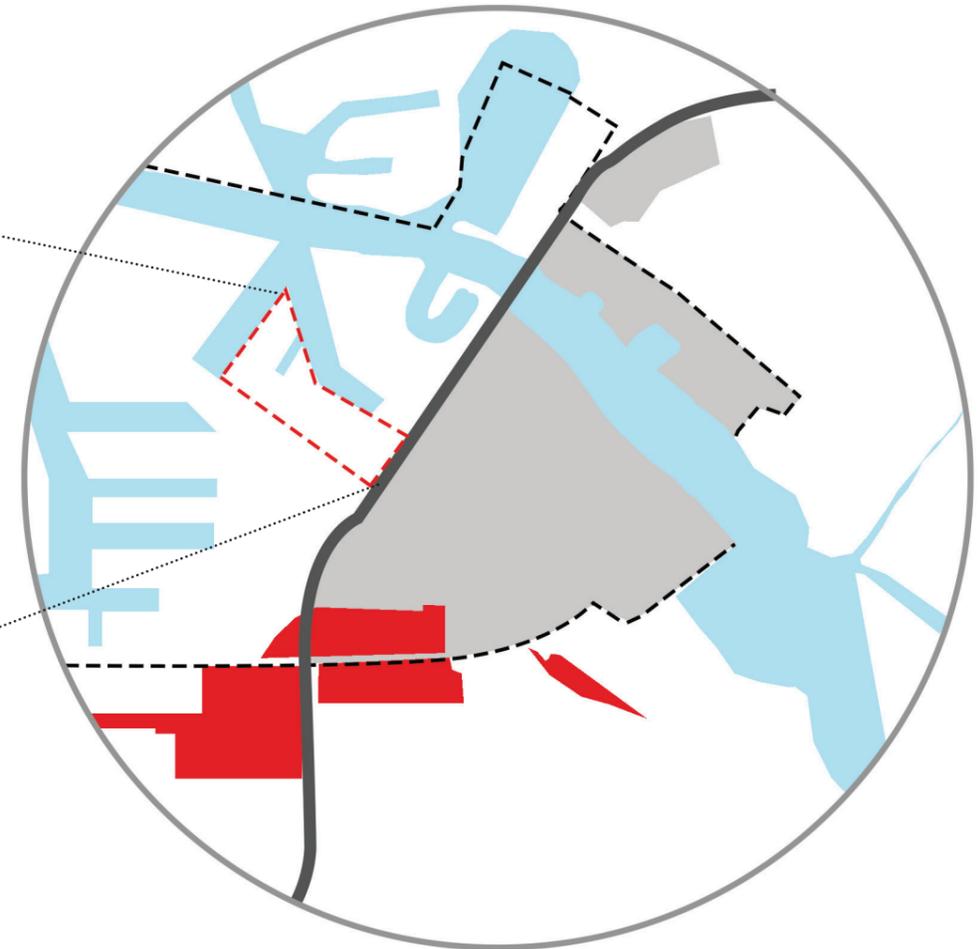

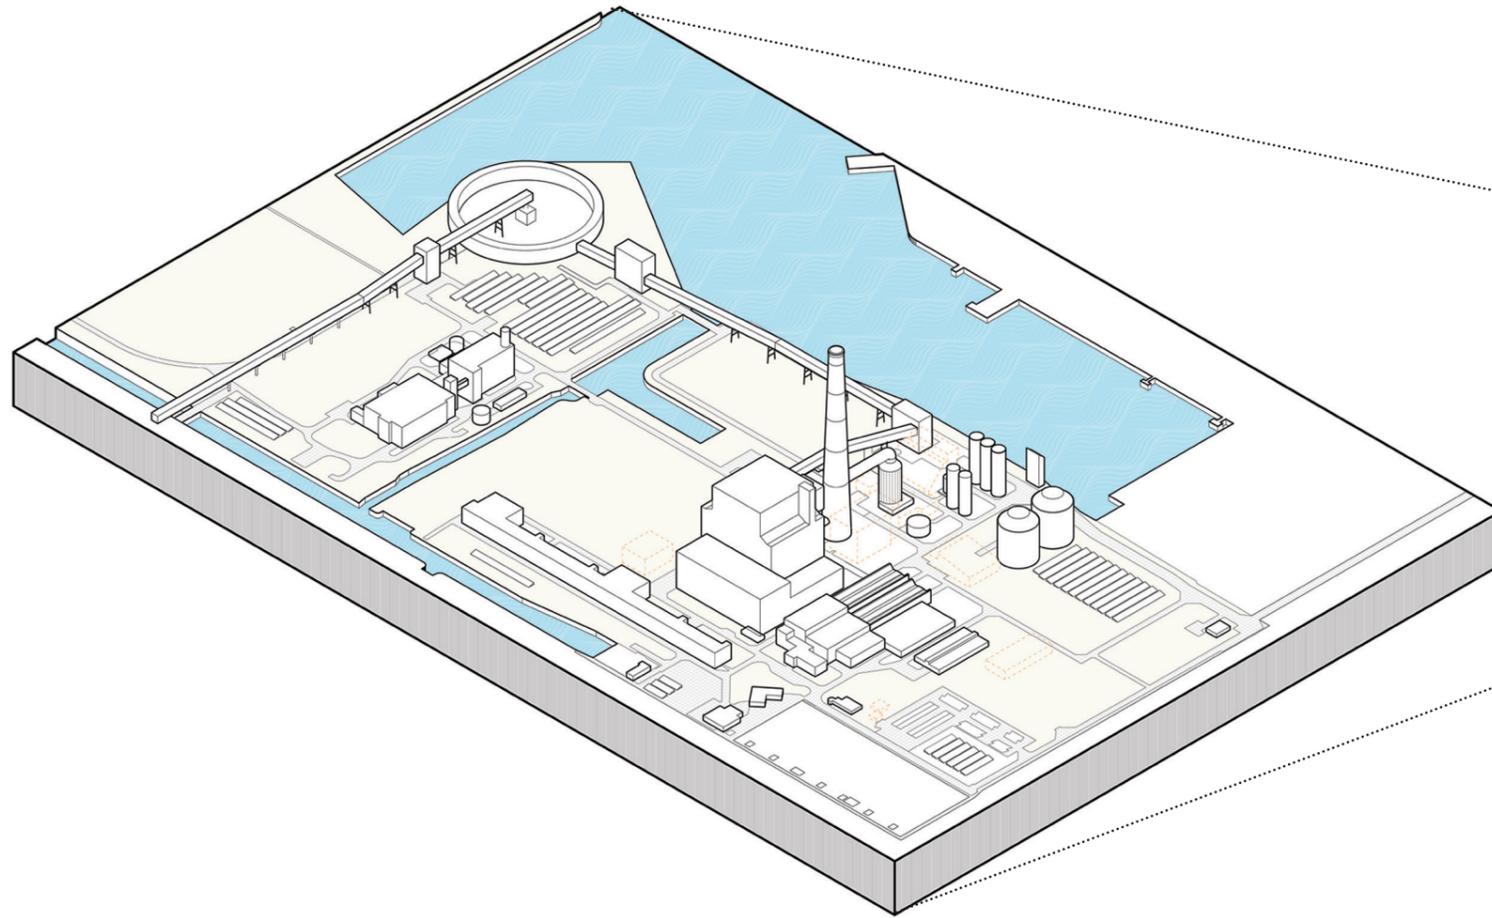

20.500 jobs

2019

>2018b:  
Locations

Sloterdijk Centrum-Noord,  
Sloterdijk I-Noord.

**Dismantling structures** and machinery

**New program** introduced.

Introducing the context to the city.

**627.000** m2 total BVO (Total 2.427.000)

**6.300** homes (Total 21,100)

**125.500** m2 BVO non-residential  
(Total 739.000)

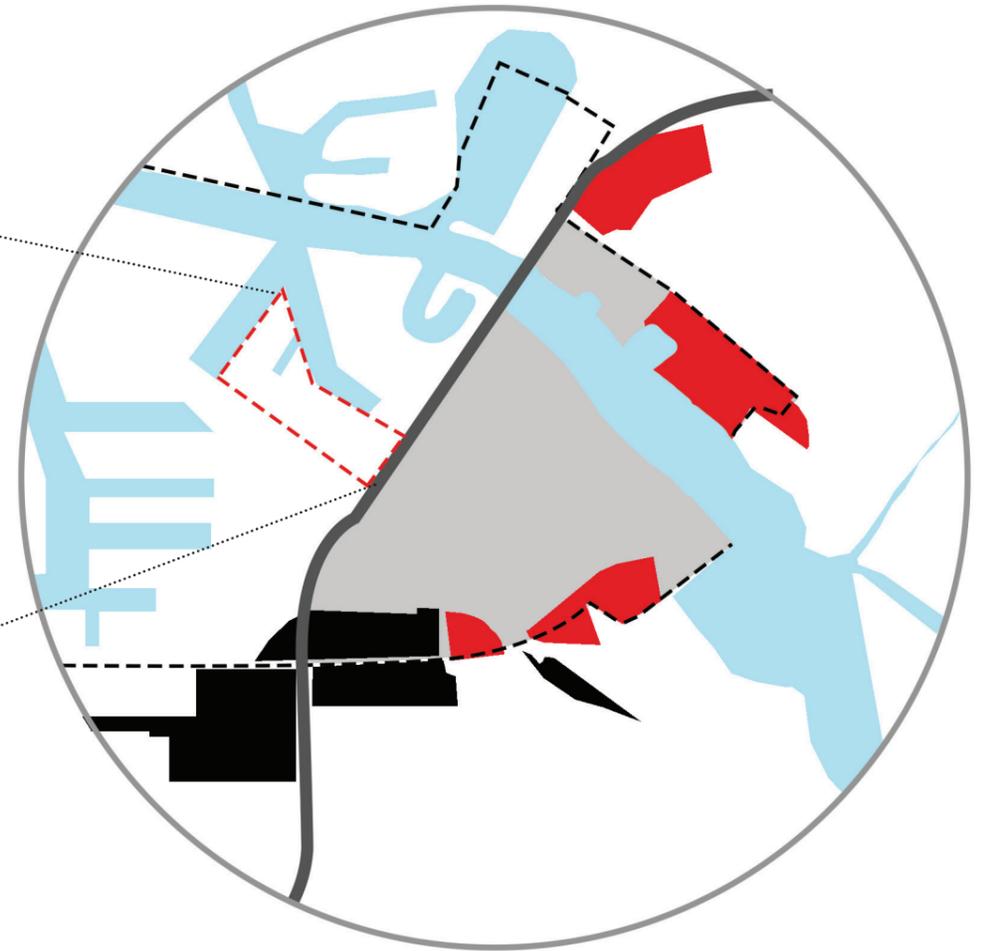

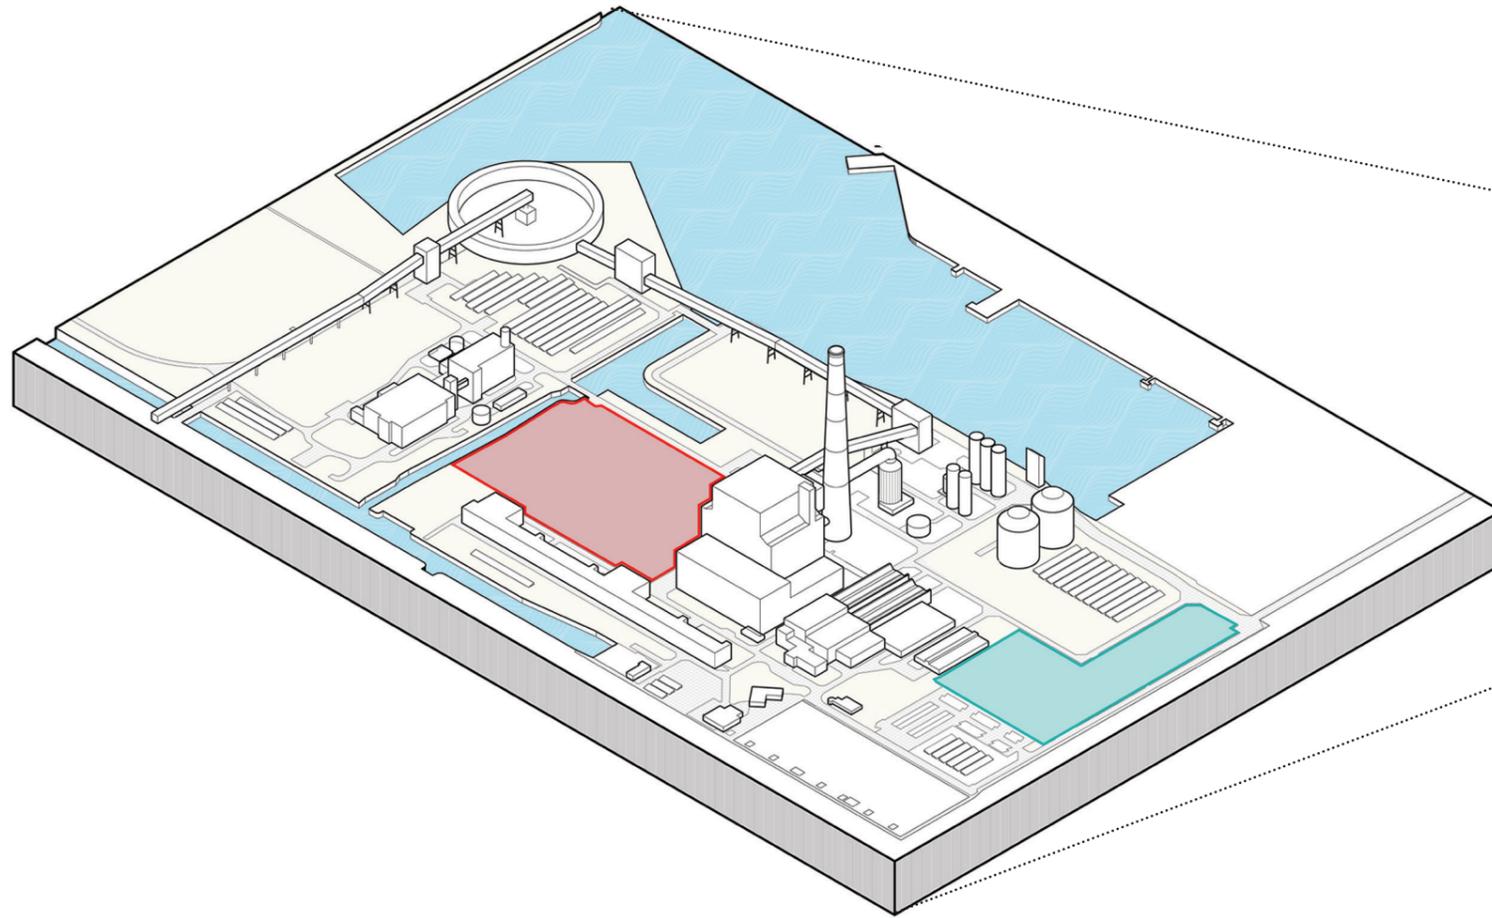

**4.200** jobs (Total 24.700)

2023-2029

>2029a:  
Locations

Sportak Transformatorweg,  
Zonnehoek/ Minervahaven,  
Cornelis Douwes, Melkweg Oostzanerwerf.

**Dismantling** flue gas treatment plant, auxillary functions and structures on site.

**Programs** like machine park and exoskeleton park opened.

Additional programs like concert spaces, pop-up exhibitions, expo, Dutch design weeks, sports activities introduced.

 **1.914.000** m2 total BVO (Total 4.341.000)

 **19.300** homes (Total 40,400)

 **372.000** m2 BVO non-residential (Total 1.111.5.000)

 **12.000** jobs (Total 36.700)

2030

>2029b:  
Locations

Alfadriehoek,  
Hempoint/ Minervahaven-Noord,  
Cornelis Douws 0-1.

**Intervention** and design focus.

**Basalt Battery.**

**Integration of site** with the context, thereby aiming to create a cultural-hotspot for the city

**1.753.000** m2 total BVO (Total 6.094.000)

**17.500** homes (Total 57.900)

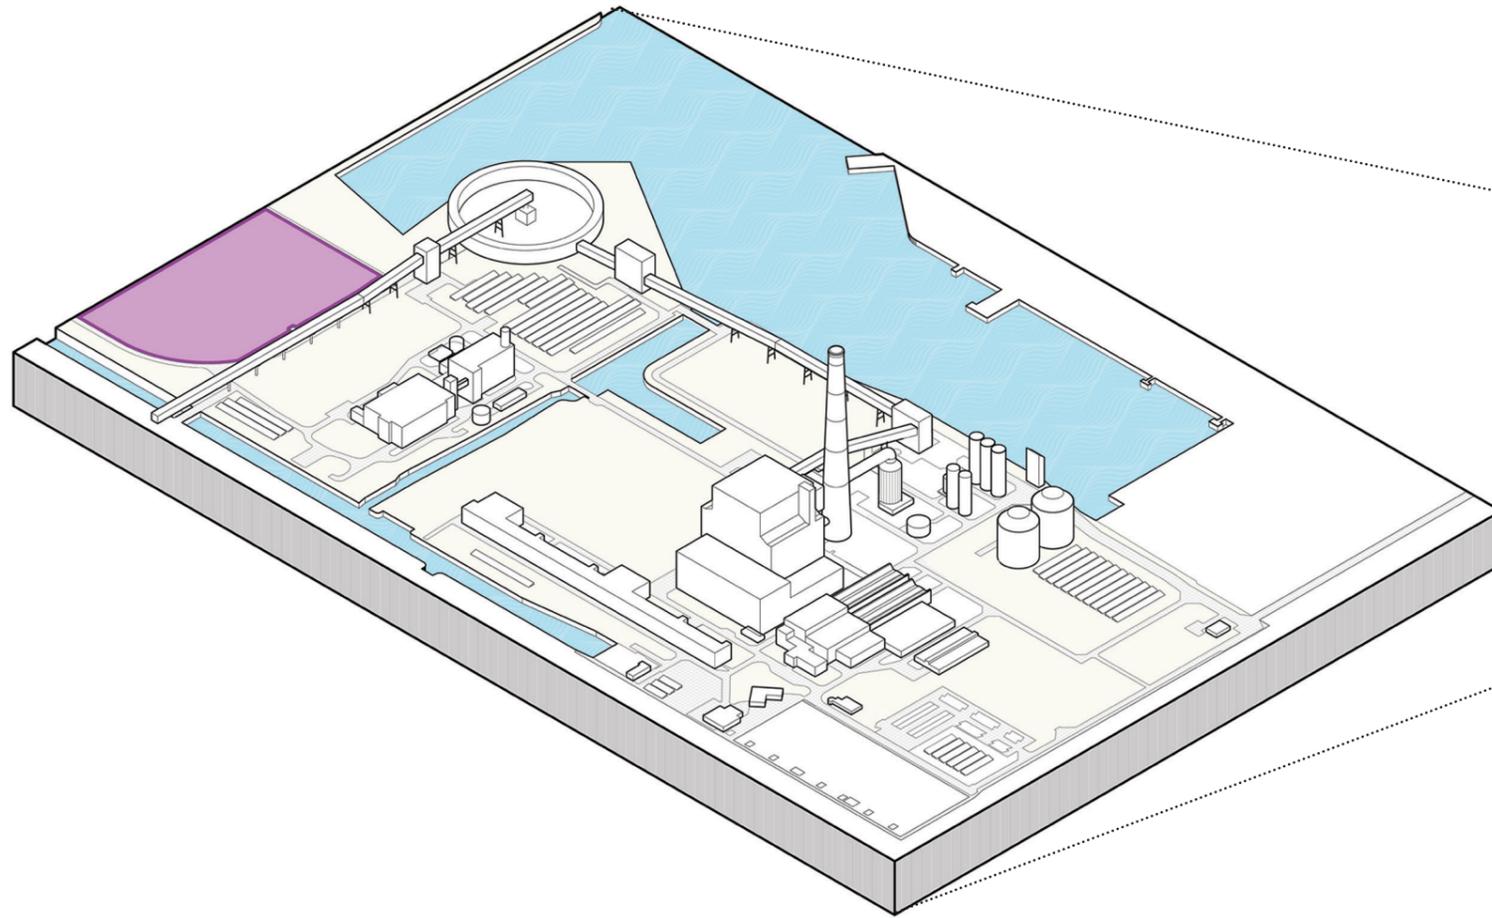

**350.000** m2 BVO non-residential  
(Total 1.461.500)

**11.700** jobs (Total 48.400)

2040

>2029b:  
Locations  
Coen-en Vlothaven.

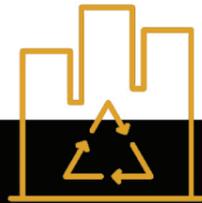

Other side of the site goes under development.

Protagonist to new developments and a catalyst to the neighborhood.

-  **1.540.000** m2 total BVO (Total 7.634.000)
-  **15.400** homes (Total 73.300)
-  **308.000** m2 BVO non-residential (Total 1.769.500)
-  **10.300** jobs (Total 58.700)

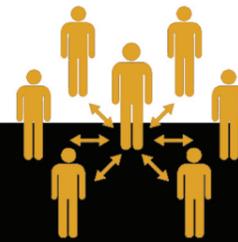

## Center for material exploration

[Material exploration center for wood & steel, but also new experiments with sustainable materials. Building provides space for implementation.]

- \_Labs & rooms with necessary equipment
- \_Startup office spaces
- \_Workshop & Incubation spaces
- \_Meeting rooms/lecture halls
- \_Small auditorium (~50-75 people)
- \_Service rooms
- \_Site redesign & maintenance office

## Recreational

[Space for interaction between people-city-material exploration]

- \_Multipurpose rooms
- \_Indoor exhibition spaces
- \_Cafe, Shop & services
- \_Office for recreational activities

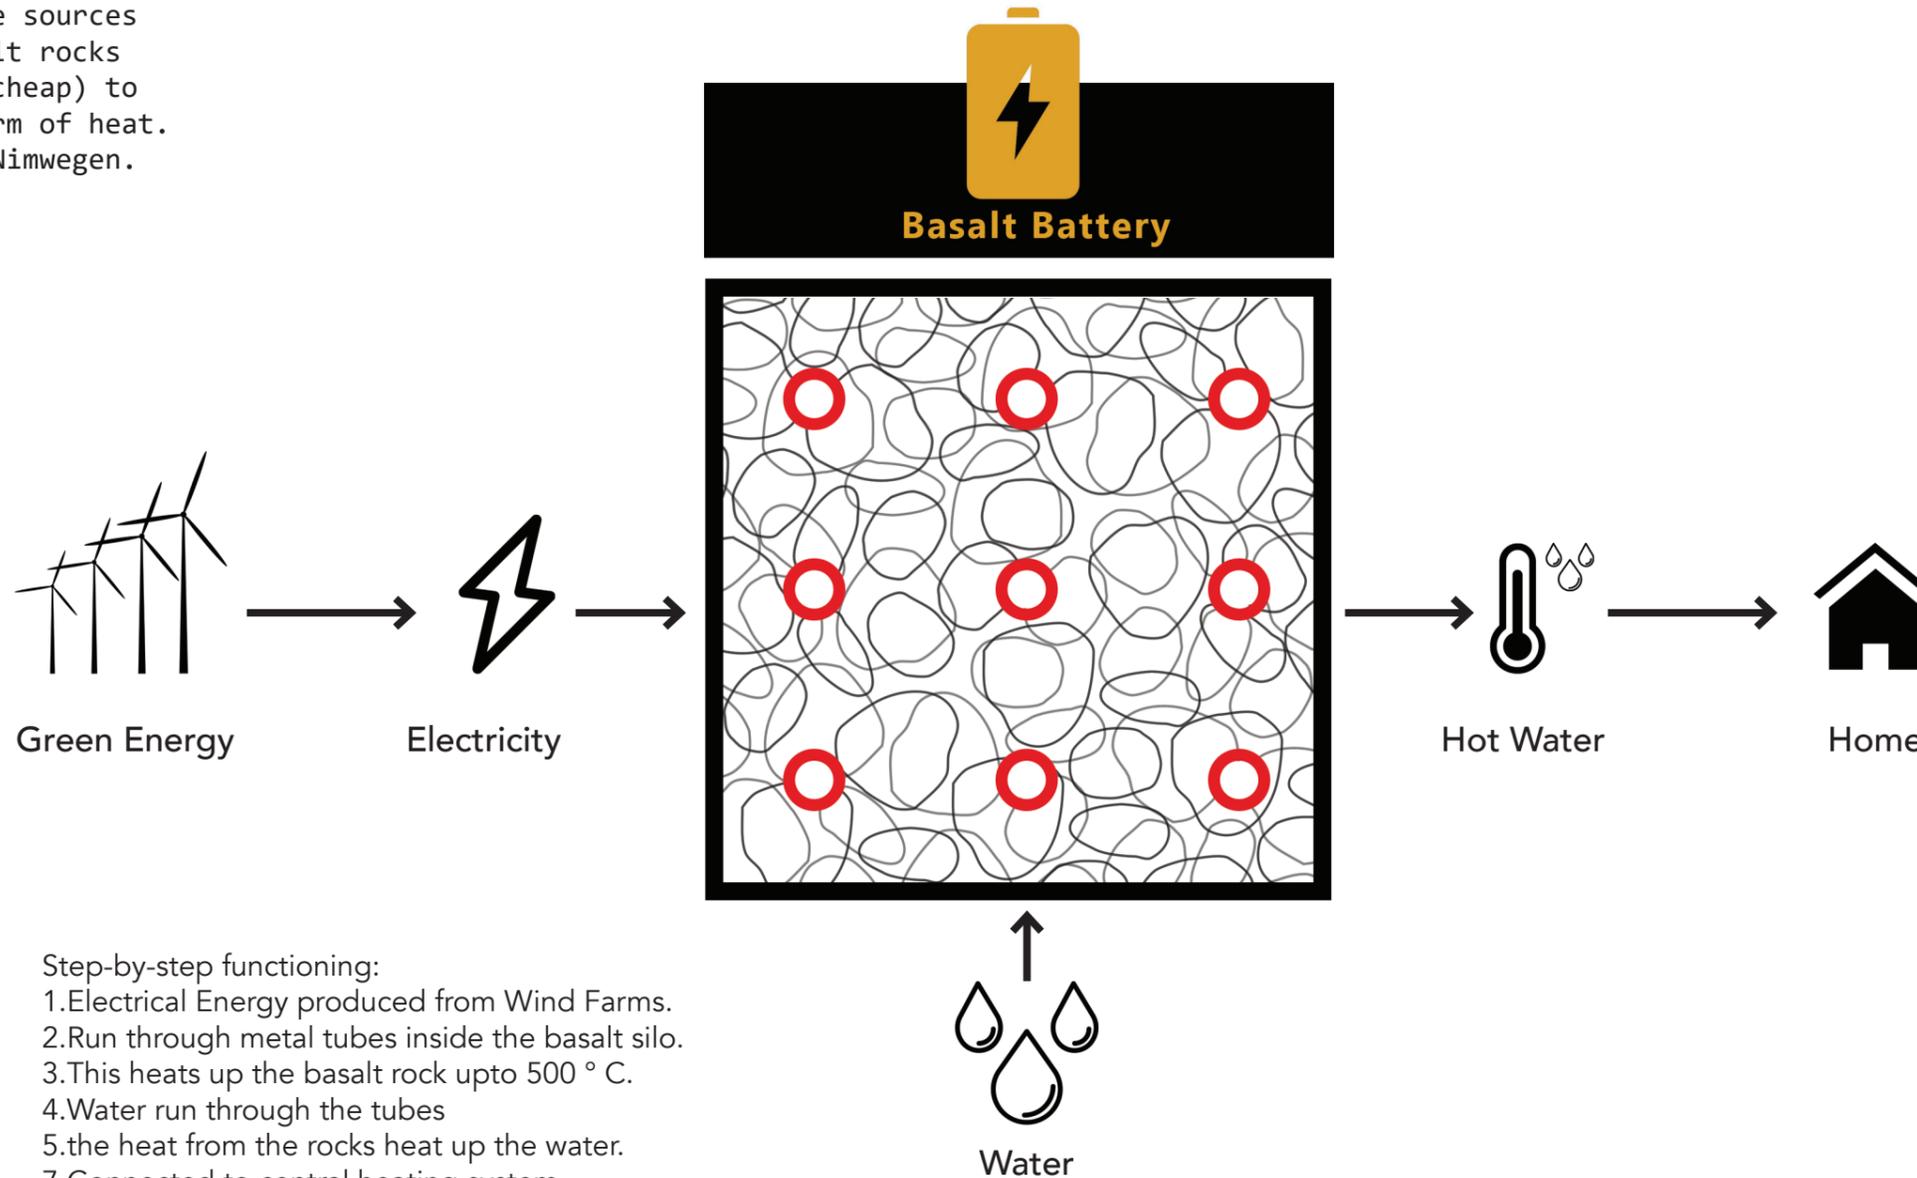

## Basalt Battery

Use of Basalt rocks to store Green energy in the form of heat and supply it to nearby facilities for heating.

- \_Central basalt battery core
- \_Services and auxillary programs

# BASALT BATTERY

When Green Energy is in abundance  
 - how do we store it?  
 2019 Climate agreement clearly  
 states that we need to transition  
 from gas to sustainable sources  
 of energy. Use of basalt rocks  
 (easily available and cheap) to  
 store energy in the form of heat.  
 Developed by Cees van Nimwegen.

Step-by-step functioning:

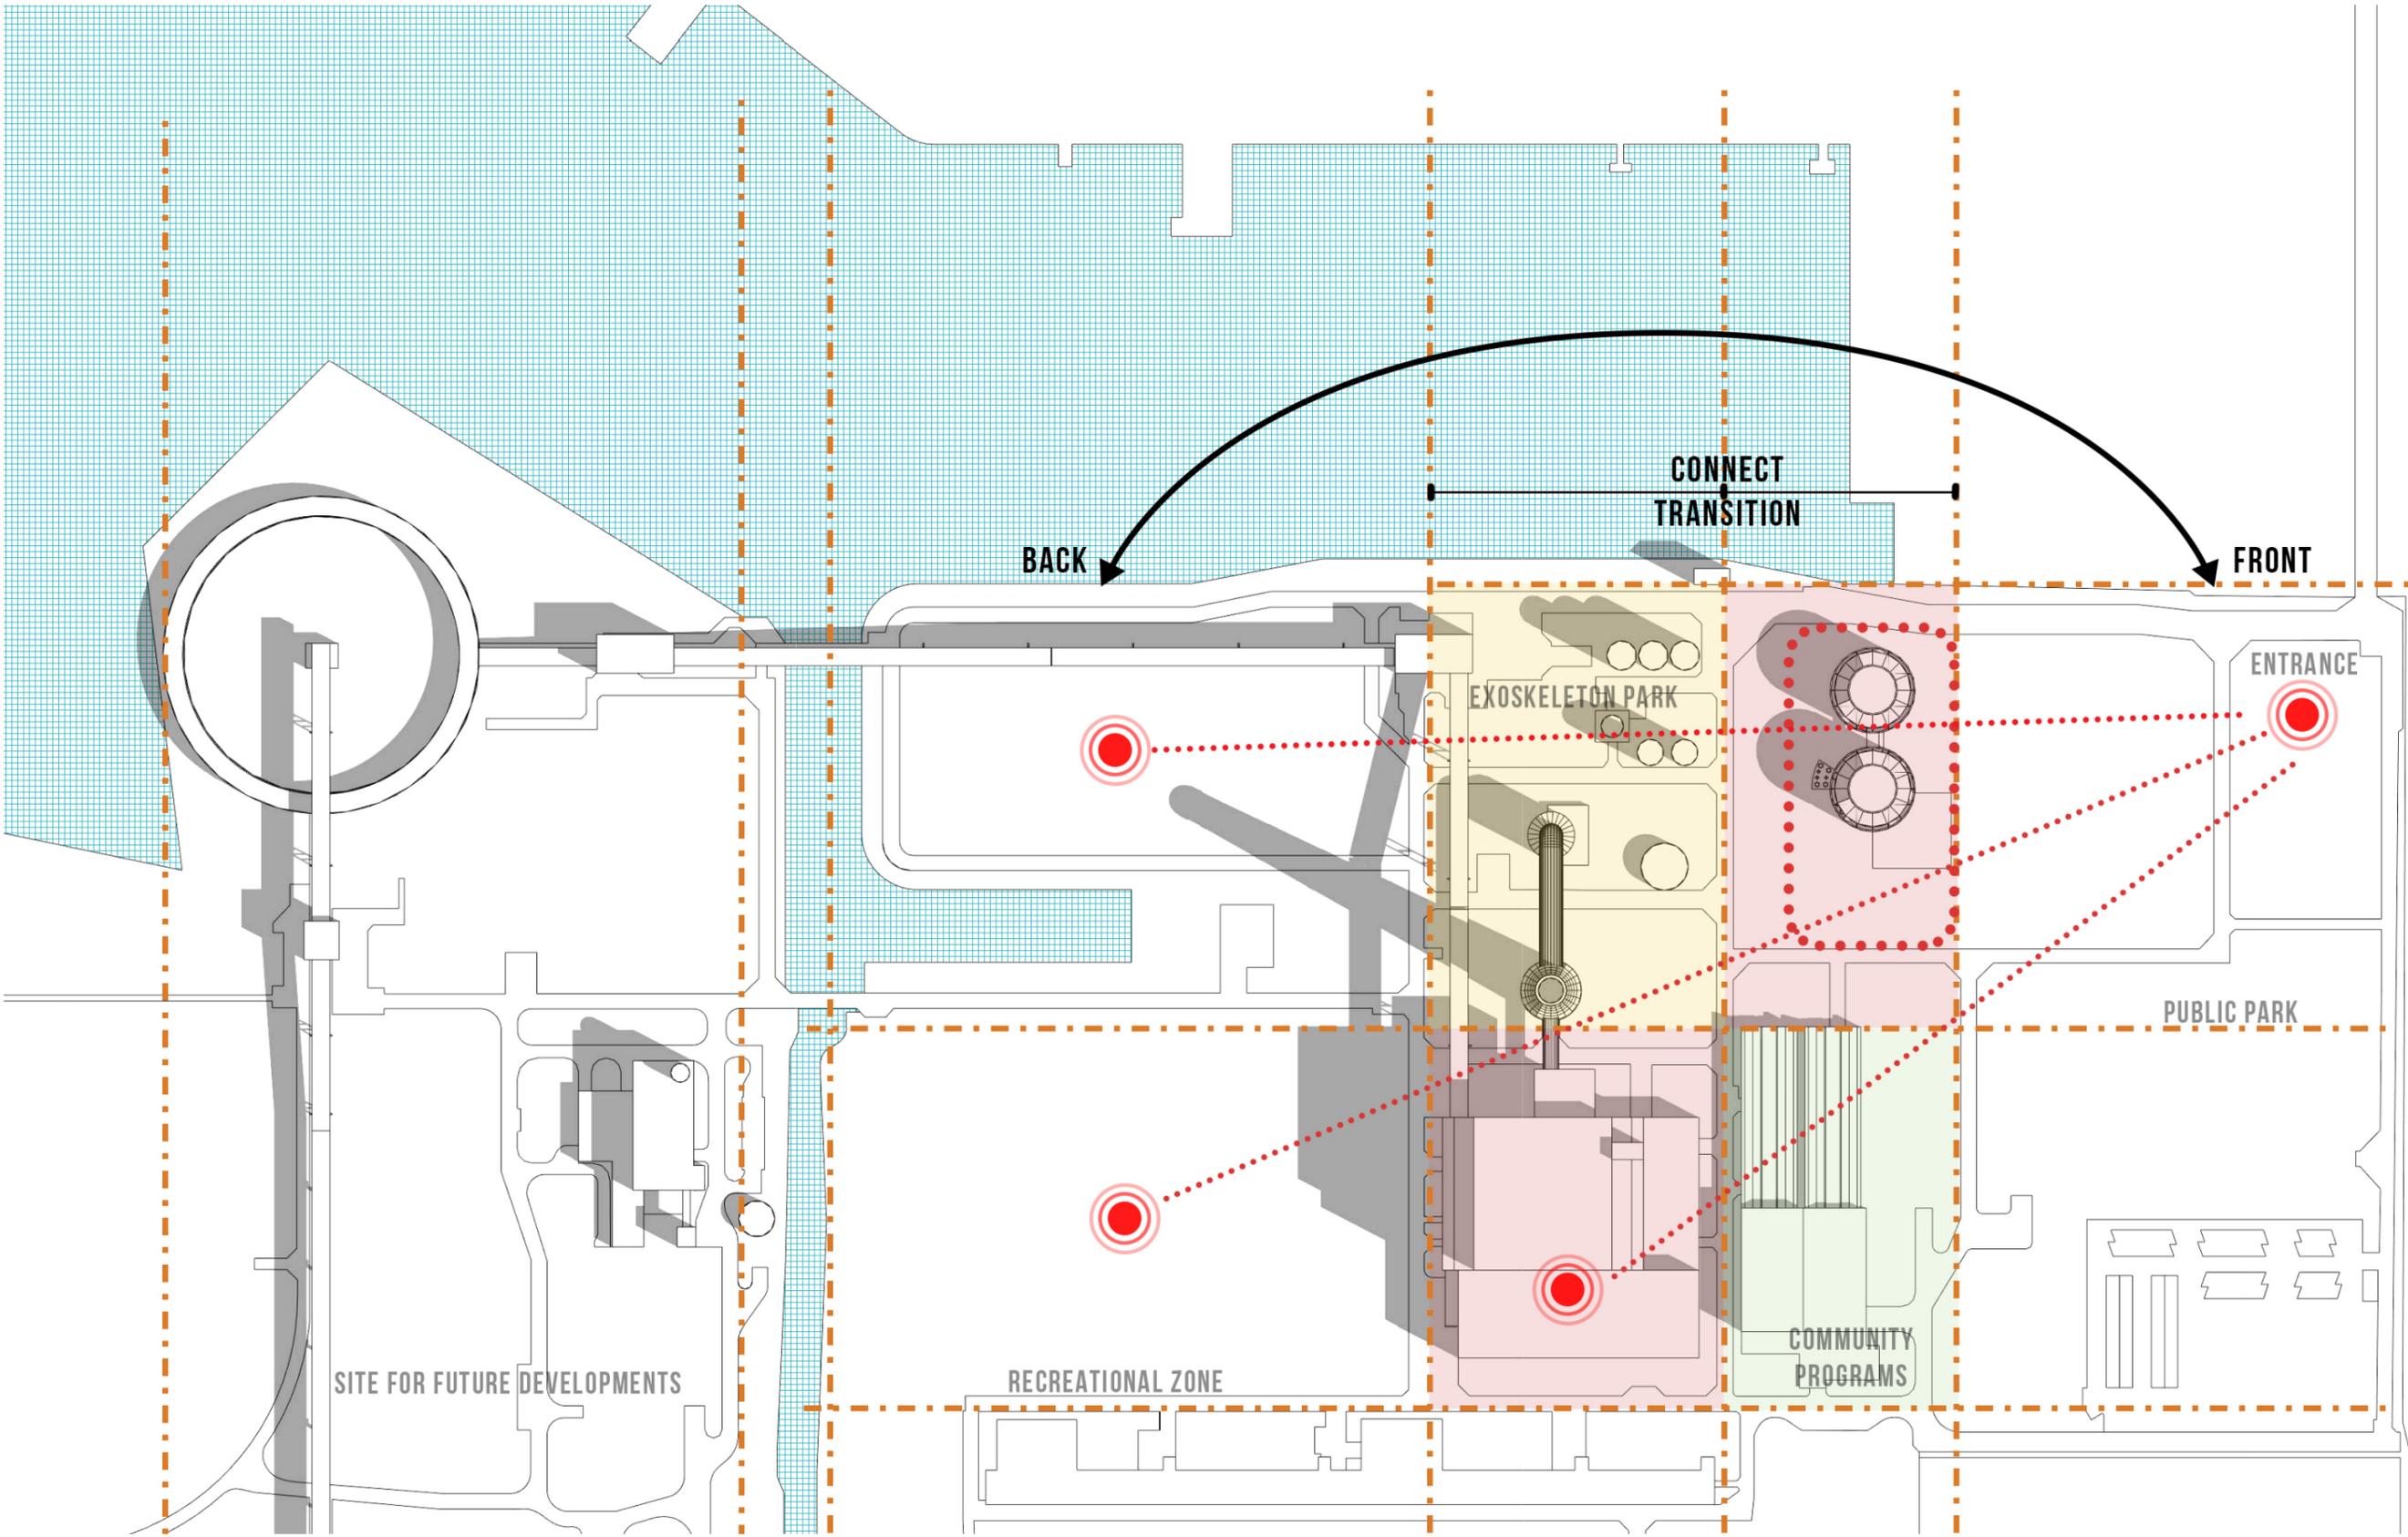

1. Electrical Energy produced from Wind Farms.
2. Run through metal tubes inside the basalt silo.
3. This heats up the basalt rock upto 500 ° C.
4. Water run through the tubes
5. the heat from the rocks heat up the water.
7. Connected to central heating system.
8. Heat Supplied at home.

**400** Cubic. Meter of volume → **80.000kW hours** → **20 homes**

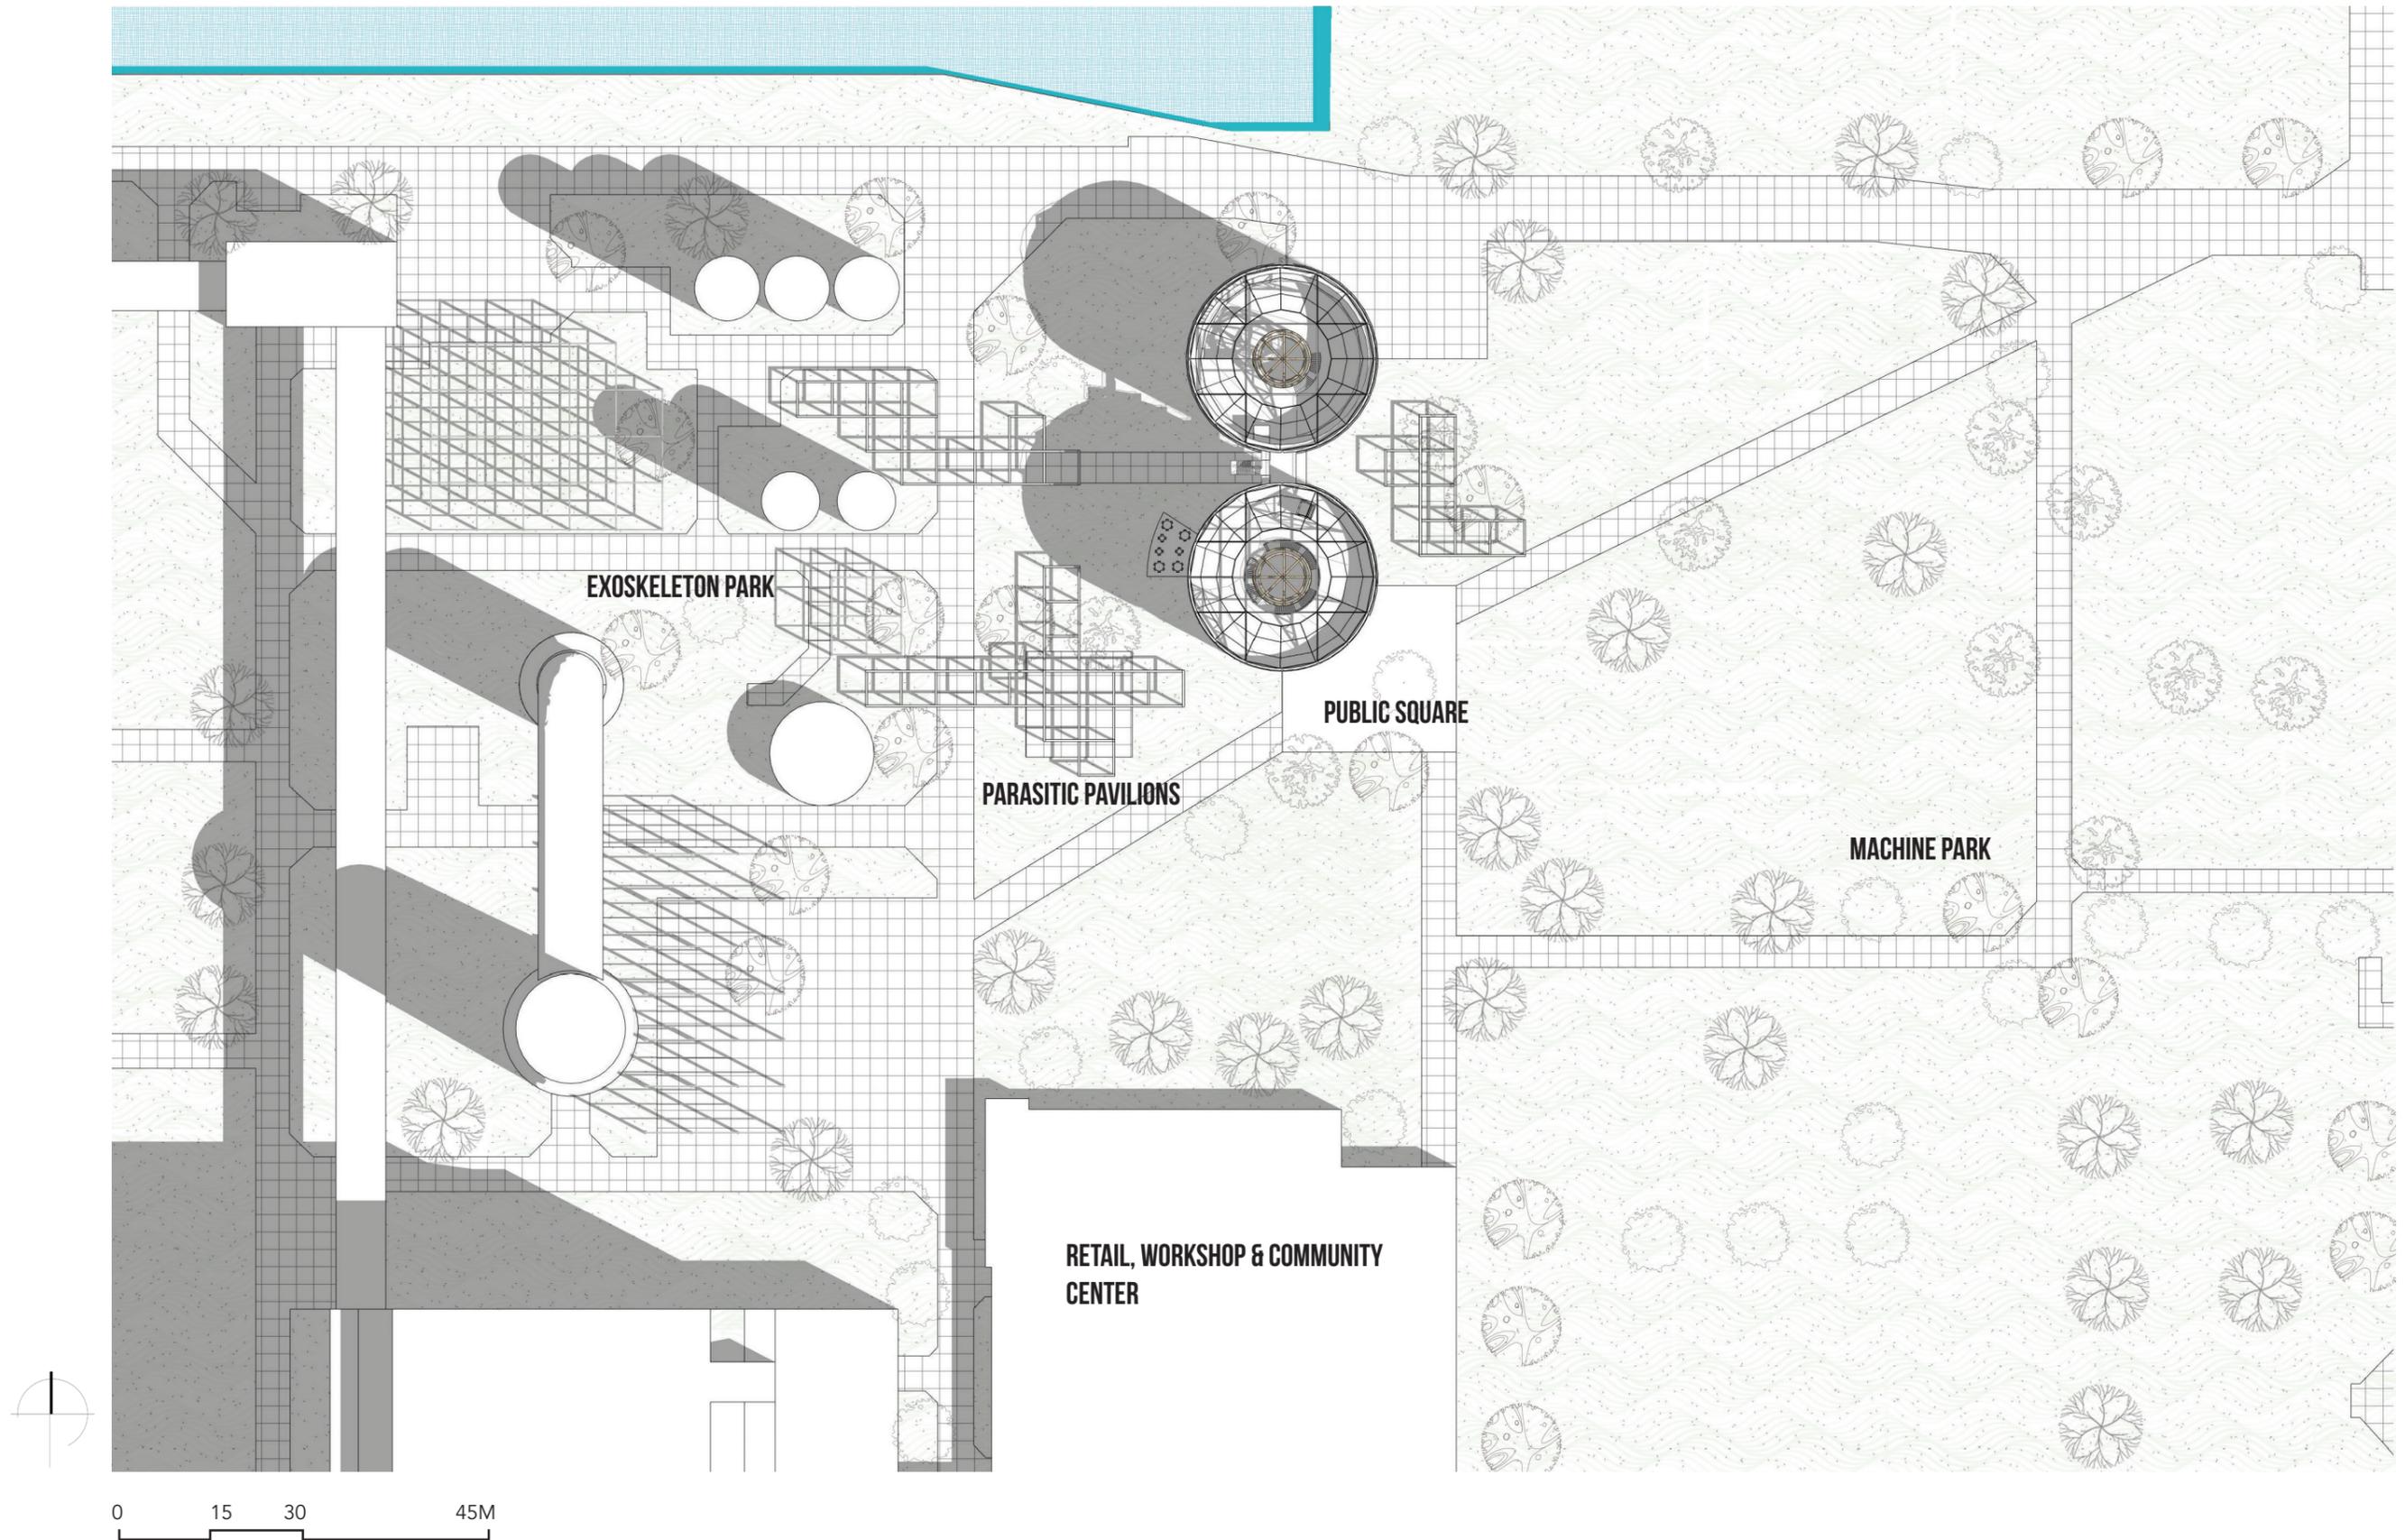

Basalt battery in my design.

**~3800** Cubic. Meter of volume → **~760.000kW hours** → **~200 homes**

## DESIGN CONCEPT : OPEN GROUND FLOOR

---

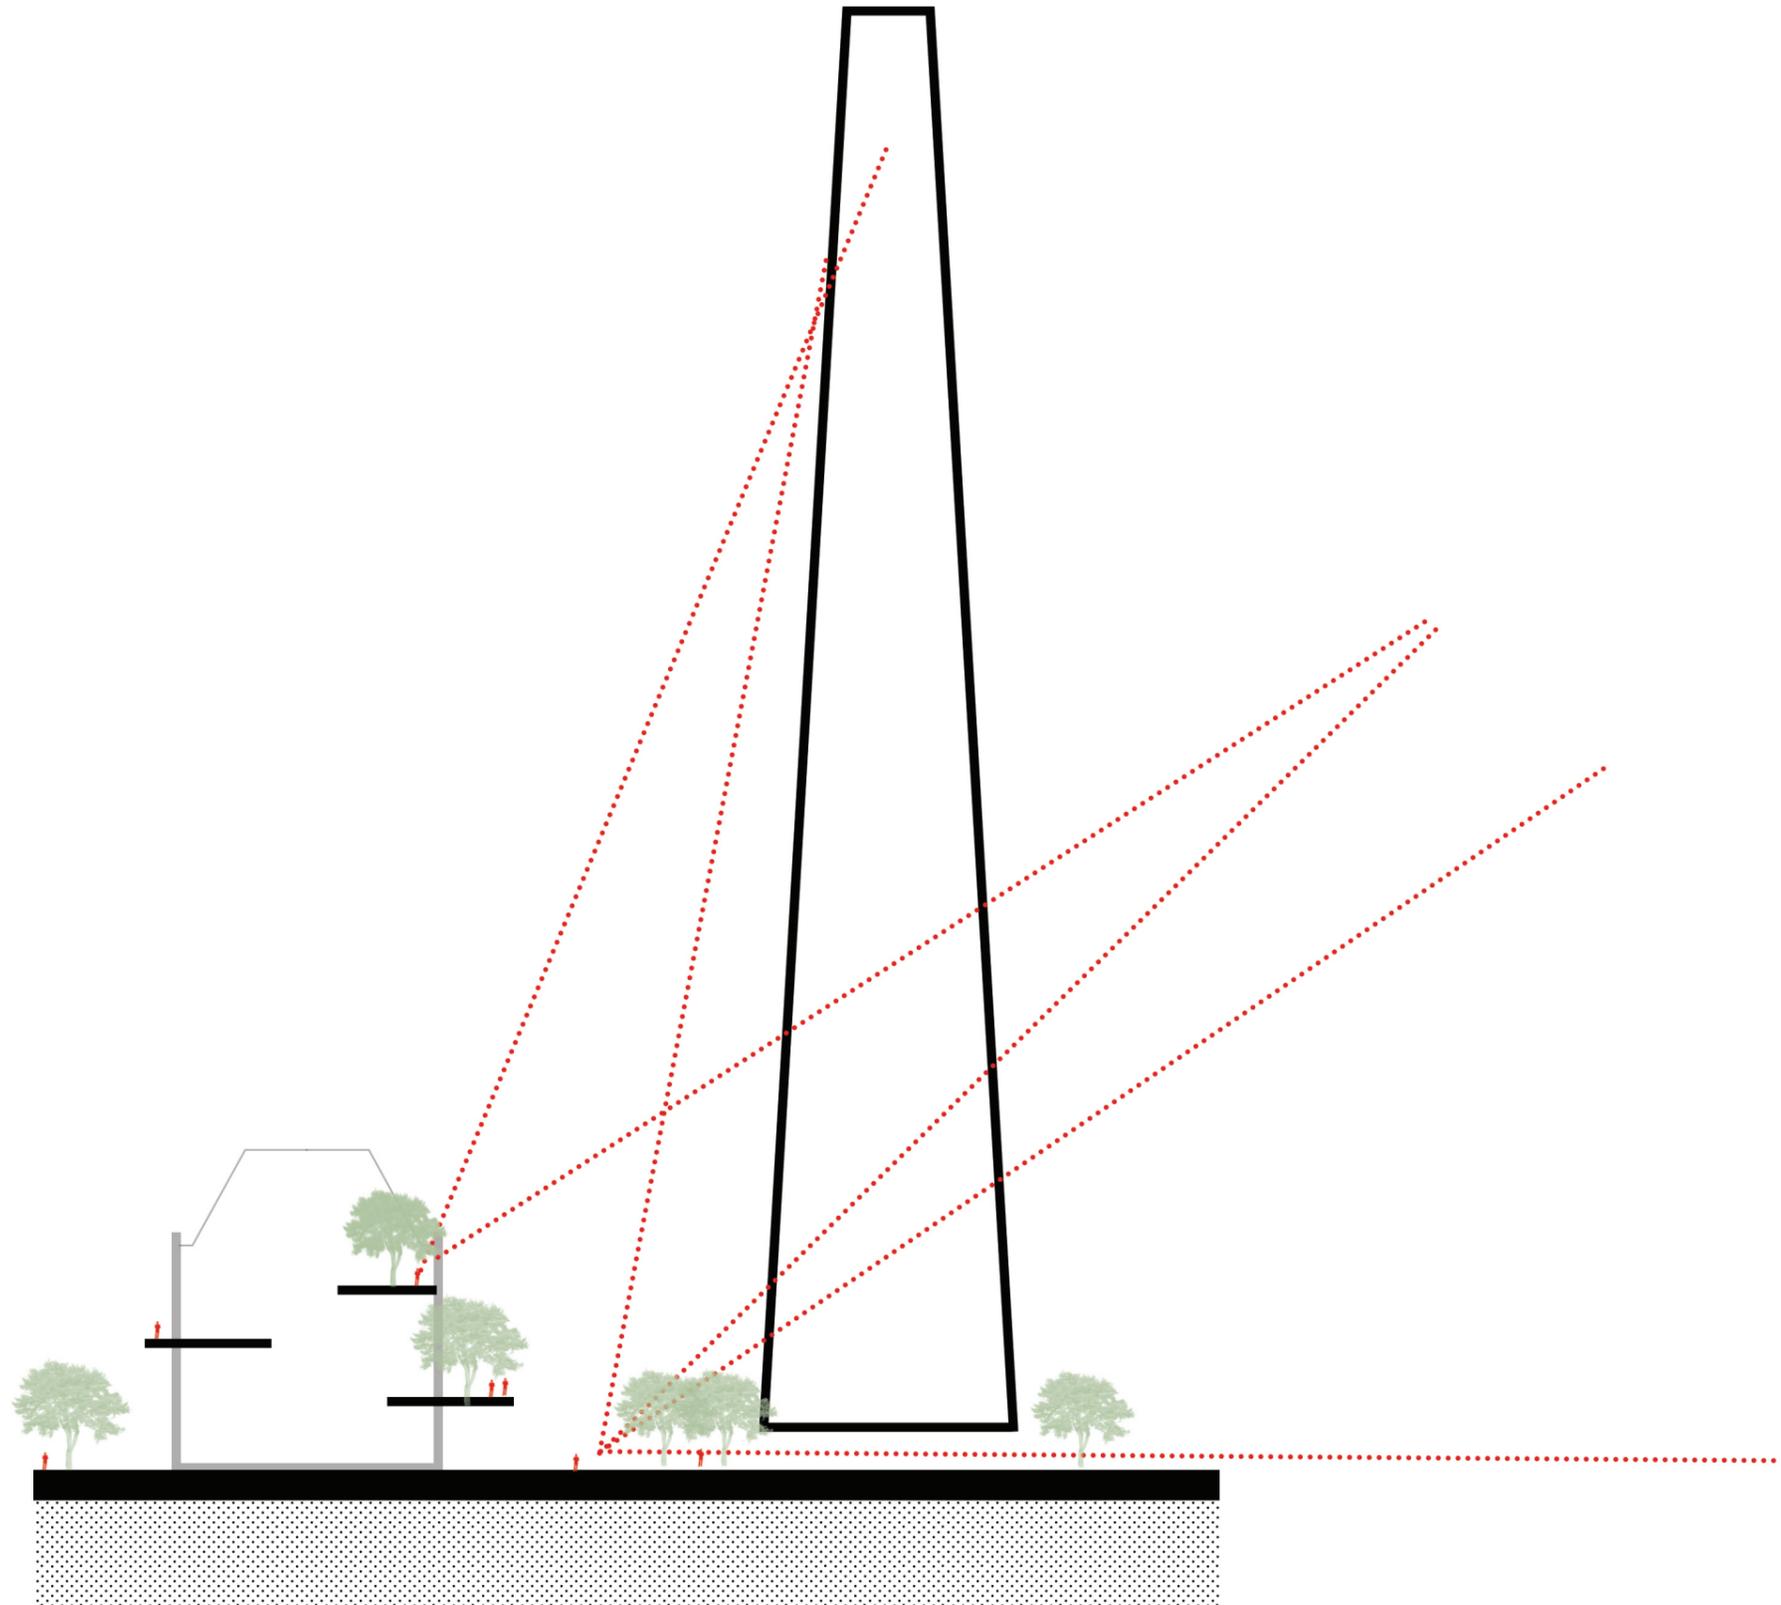

Since the building is essential in connections towards the back of the site; opening up the ground plane to facilitate a porous and continuous flow of movement.

## DESIGN CONCEPT : SCALE

With the inhumane scales of the site, with chimney and generation building being as high as 180M and 90M in height respectively, the design aims to scale to down to more human levels.

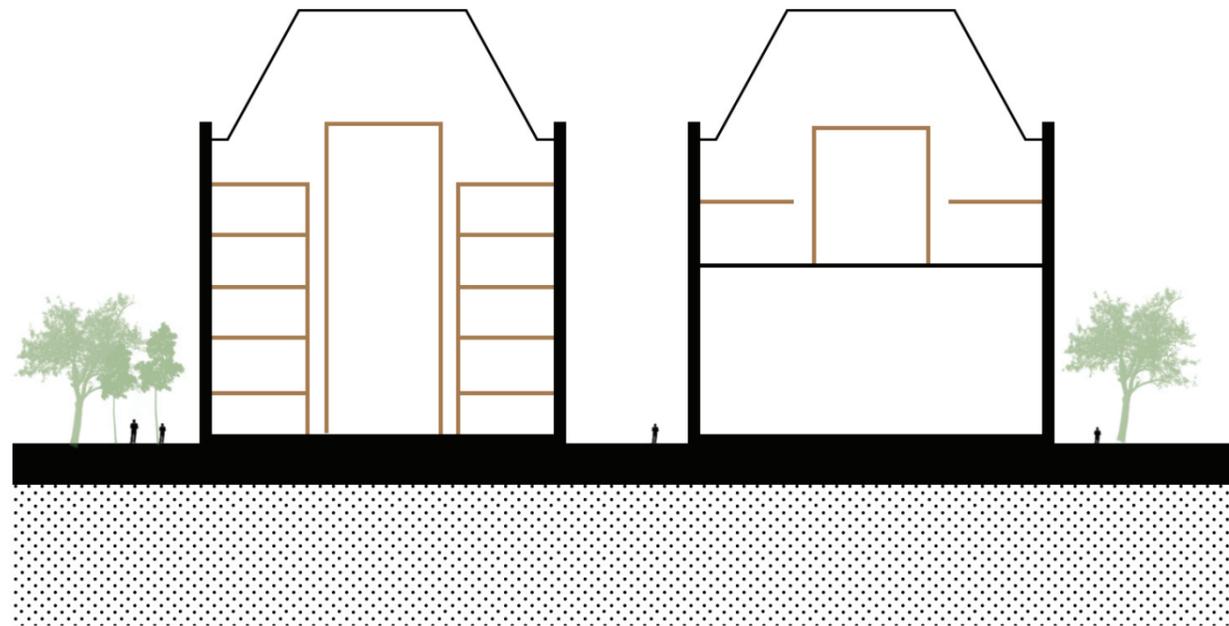

But also having visual connections towards the facilities on site.

## DESIGN CONCEPT : PARASITE

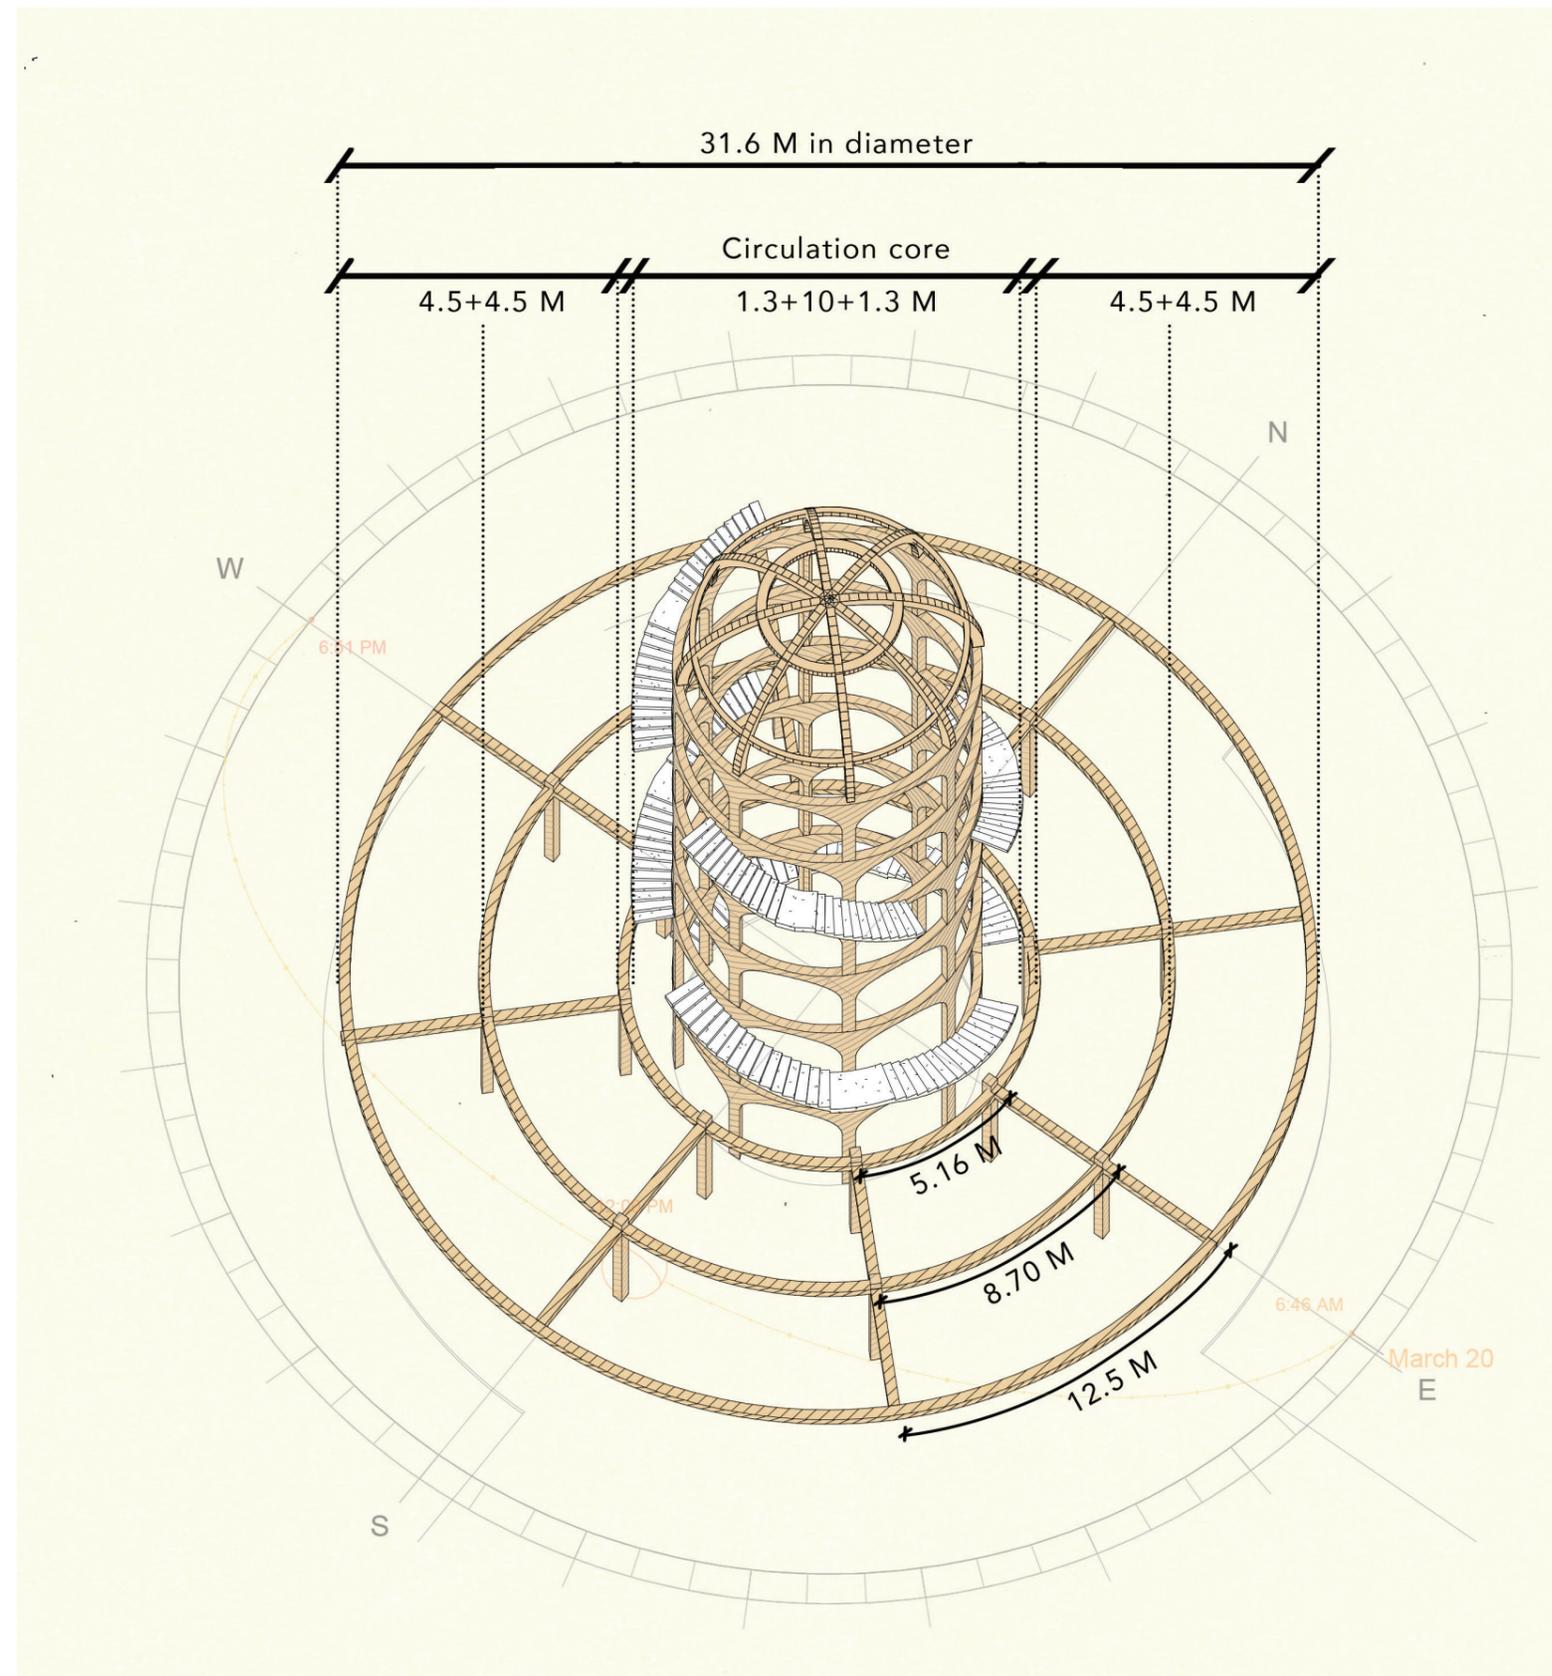

---

Parasitic design inside the existing silo. It is exaggerated in the materiality, by using a lighter material like wood in contrast to the existing concrete shell.

# DESIGN CONCEPT : MATERIALITY & STRUCTURE

Laminated veneer lumber column and beam structure with CLT slabs. The central arcade atrium is independent to which the staircase is cantilevered. BauBuche and CLT structure is anchored to the existing concrete shear walls. The dramatic circulation core in contrast to the banal industrial exterior is the guiding theme inside the building.

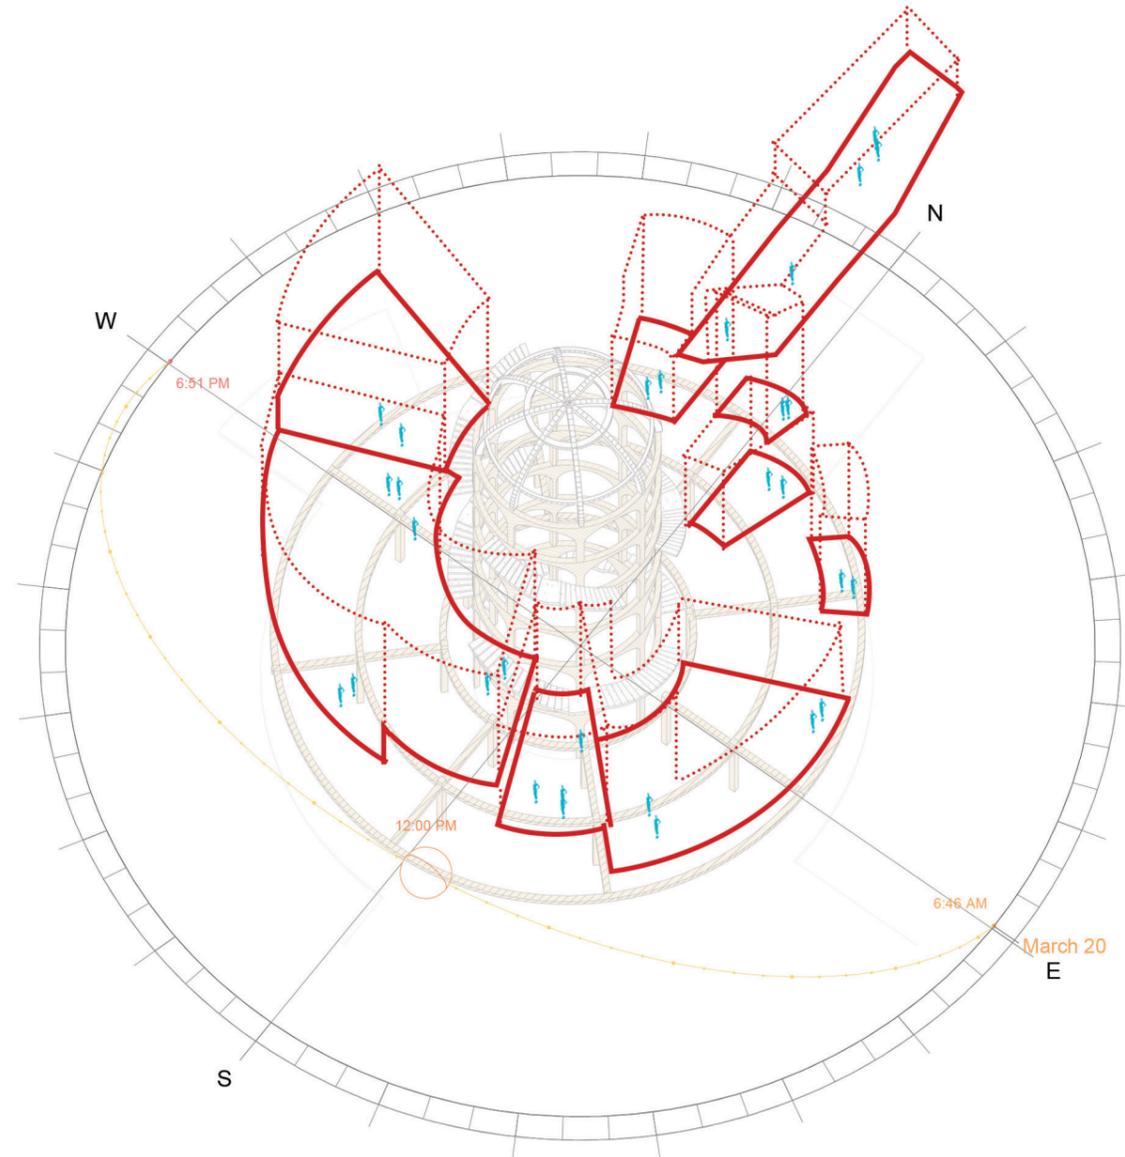

## DESIGN CONCEPT : TERRACES

The terraces connect the various levels physically and also visually. Adding another layer to the circulation with varying heights facilitating larger openings and bring light inside the building.

They also help breaking the mass down and the monotonous circulation. These cascading terraces connect various levels up to the winter garden on the top floor.

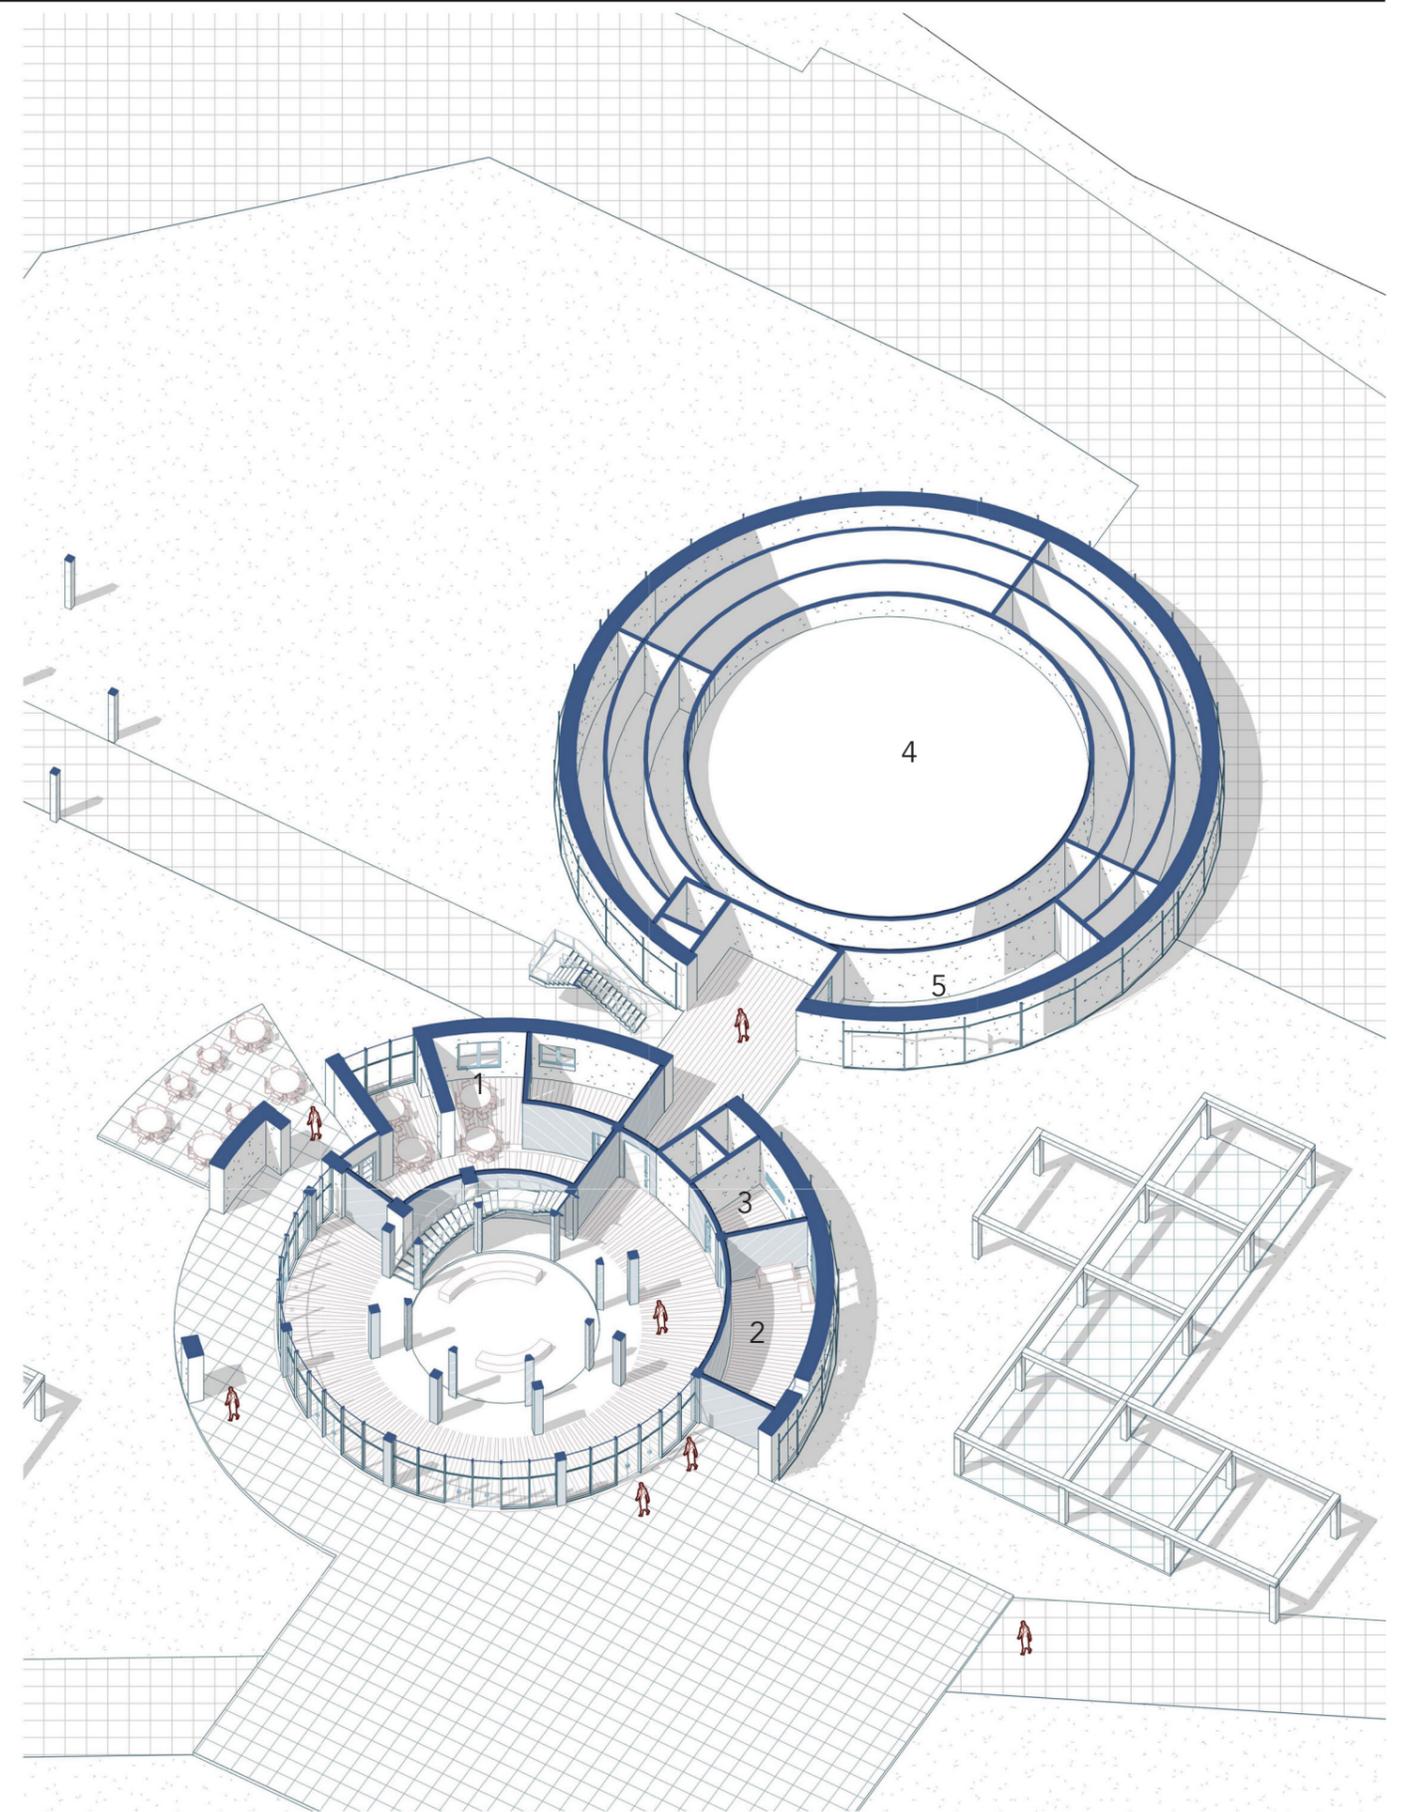

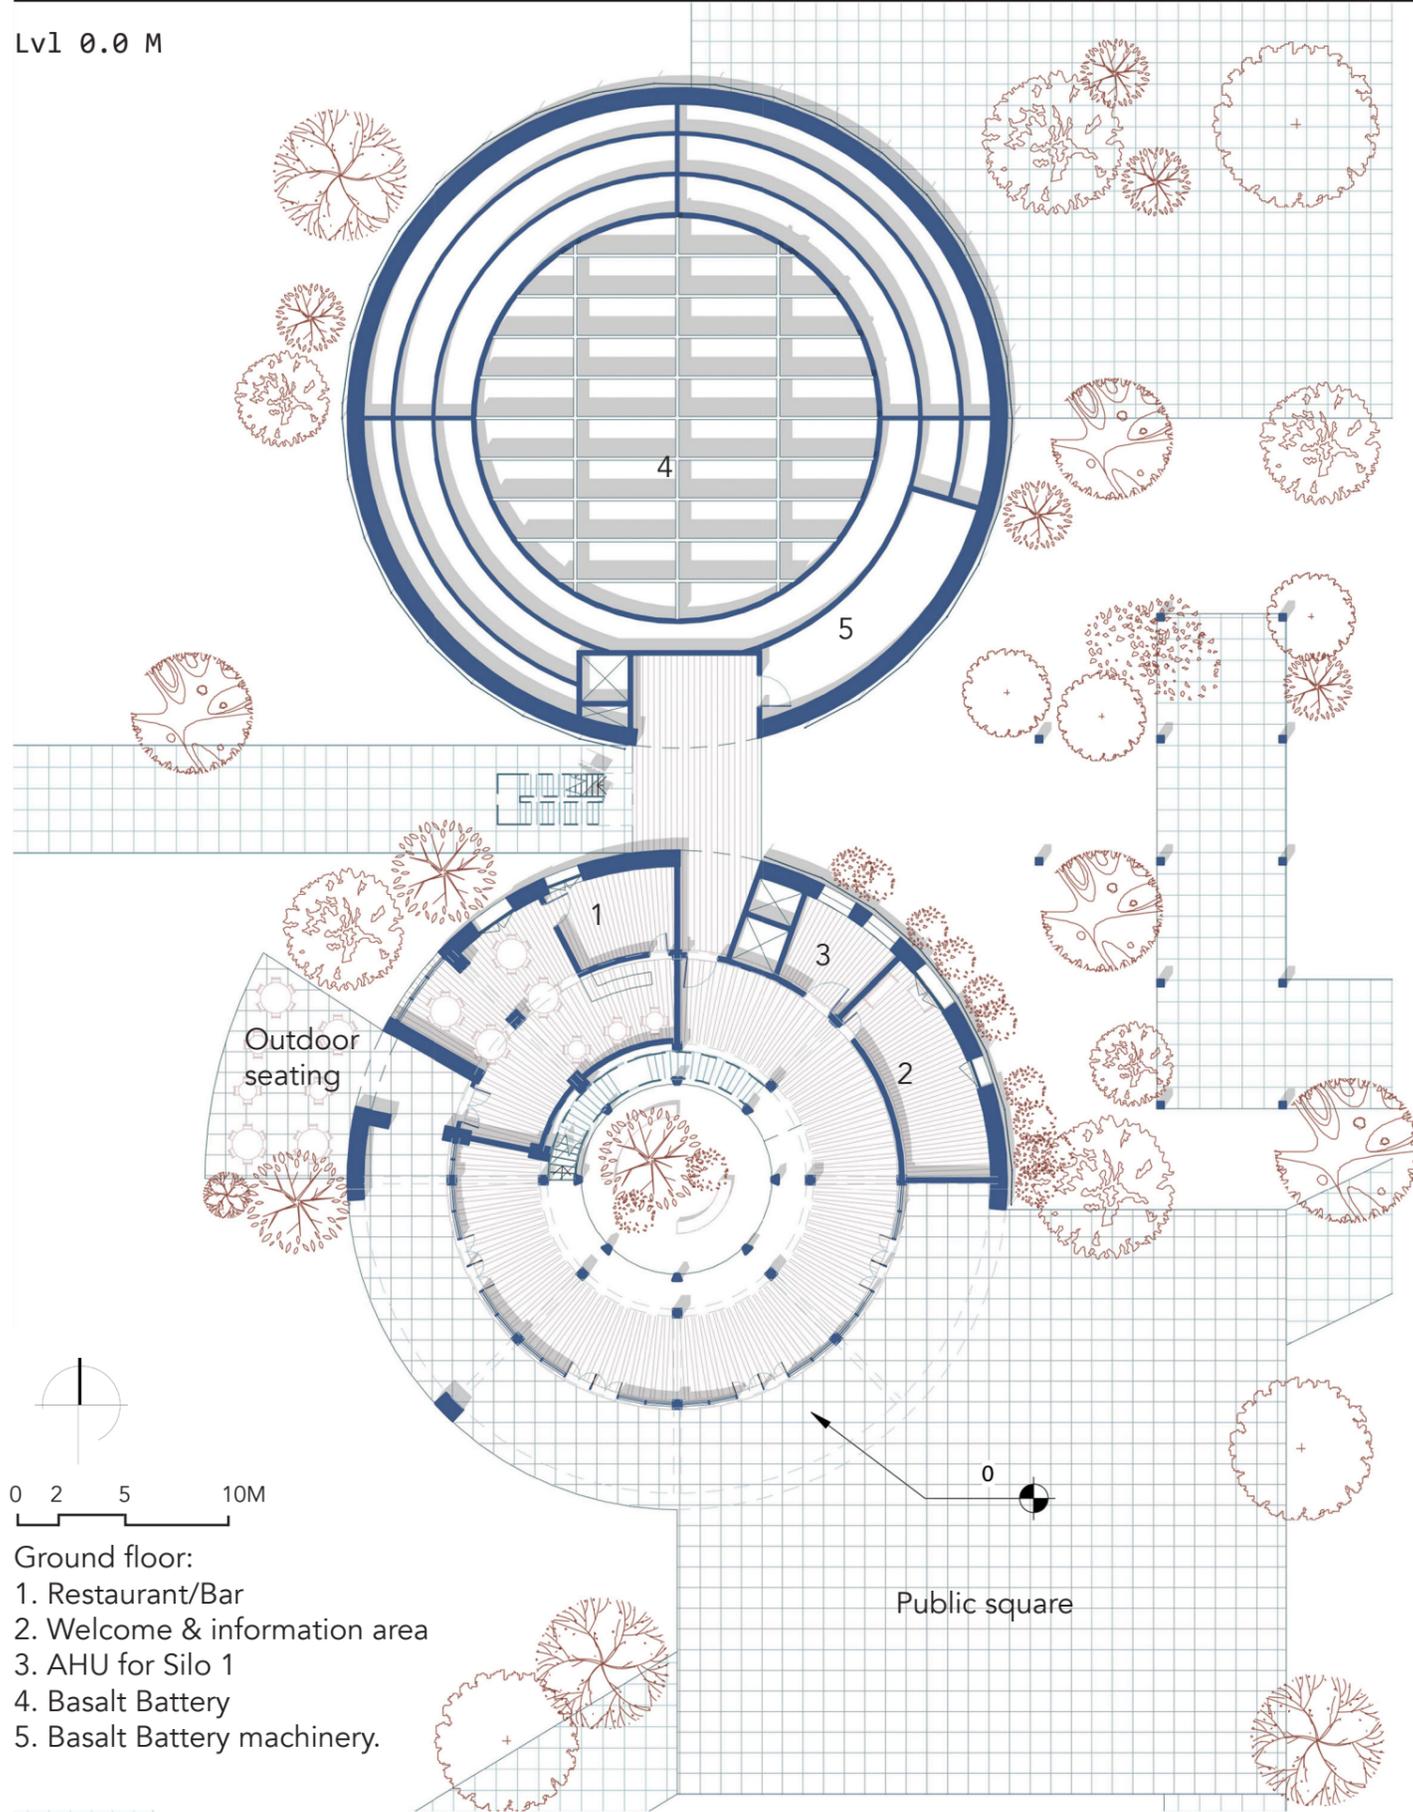

Aligned towards the south, south-west and west facade they bring light inside the building. They're also aligned to have a visual connection to the rest of the site.

# GROUND FLOOR PLAN

Lvl 0.0 M

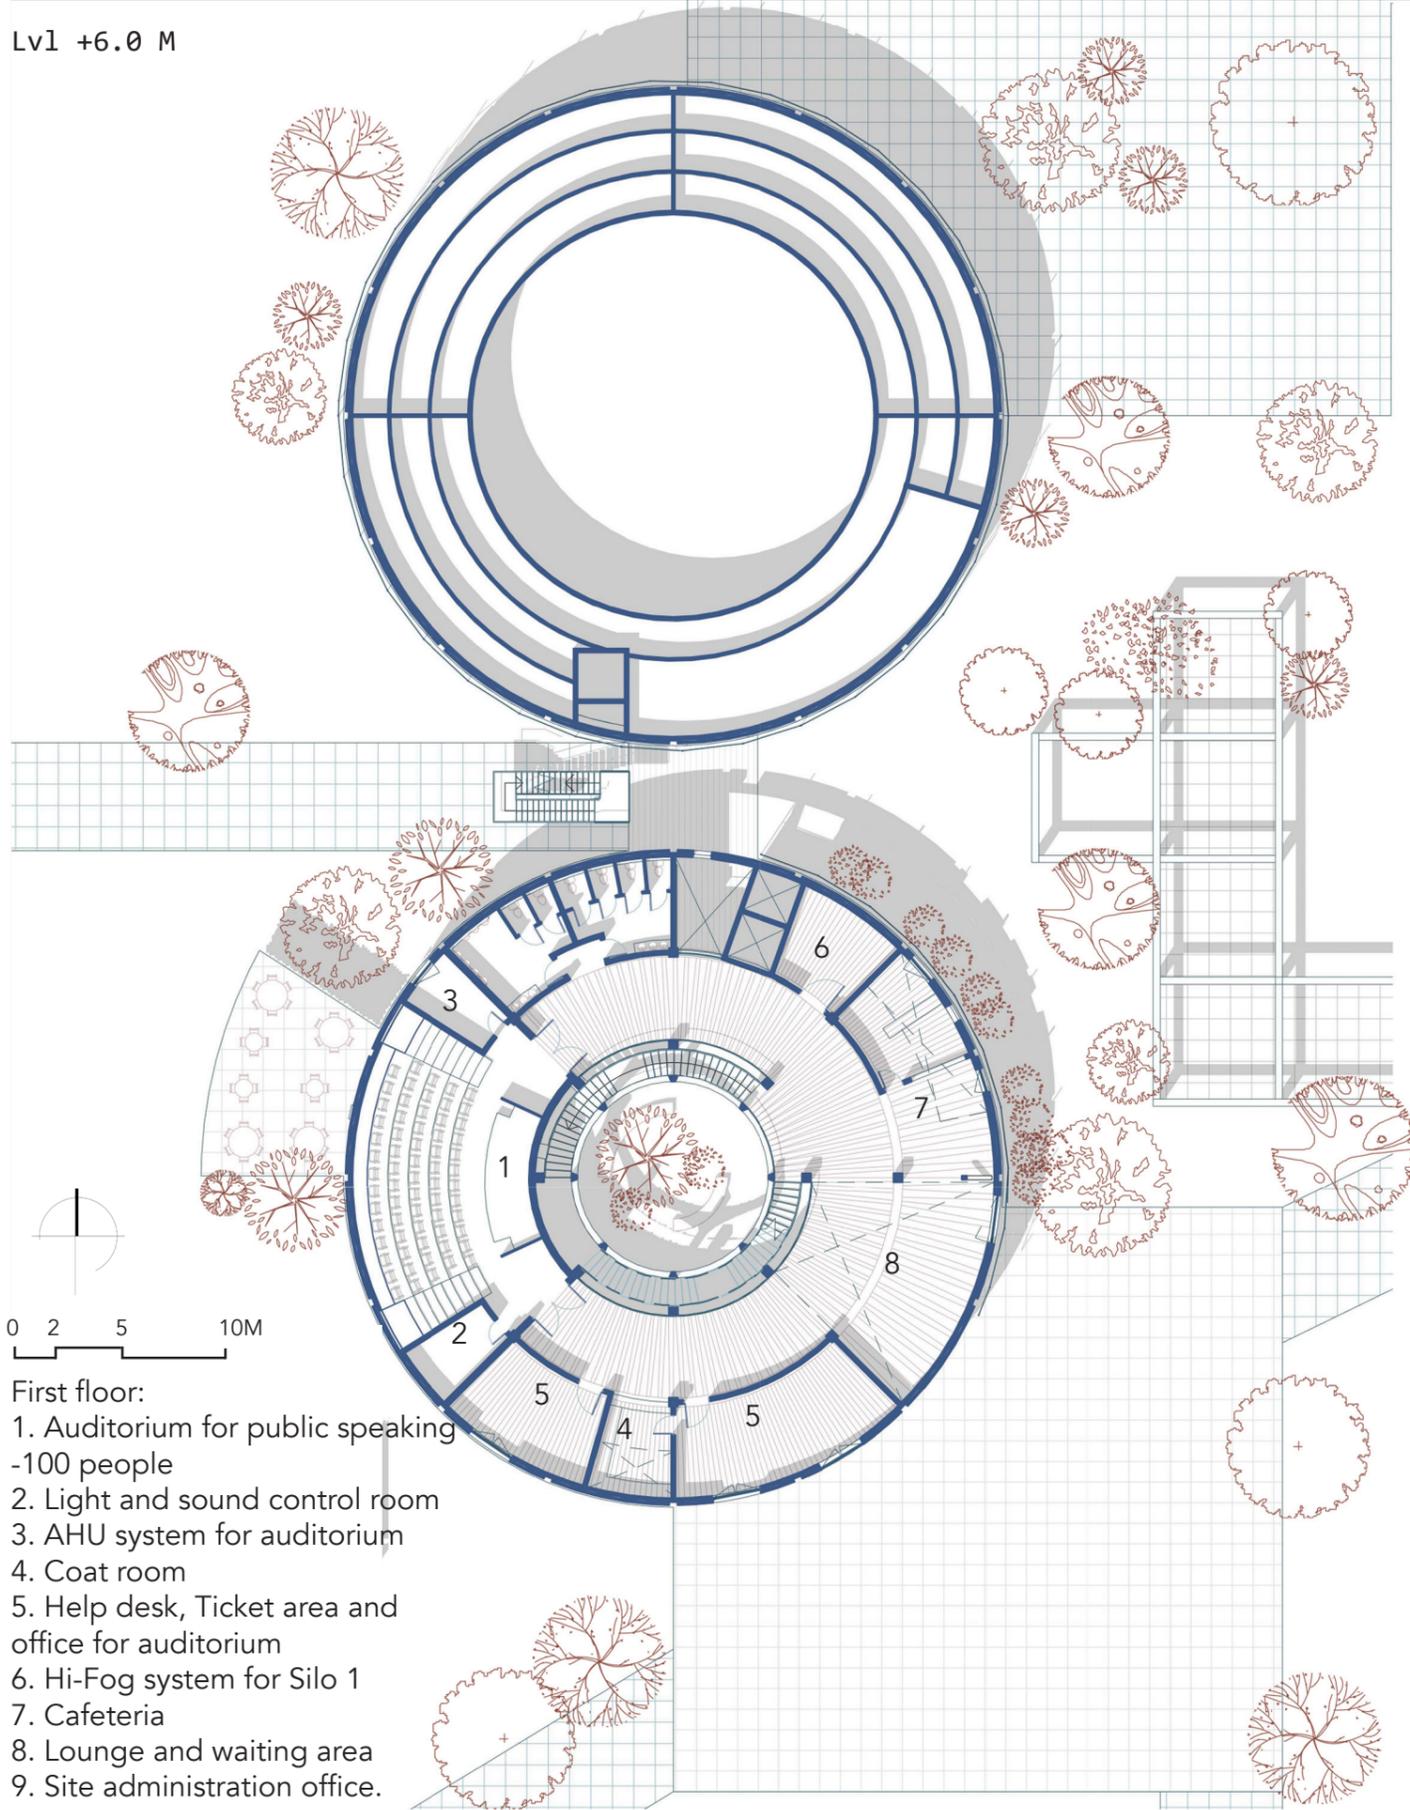

- Ground floor:
1. Restaurant/Bar
  2. Welcome & information area
  3. AHU for Silo 1
  4. Basalt Battery
  5. Basalt Battery machinery.

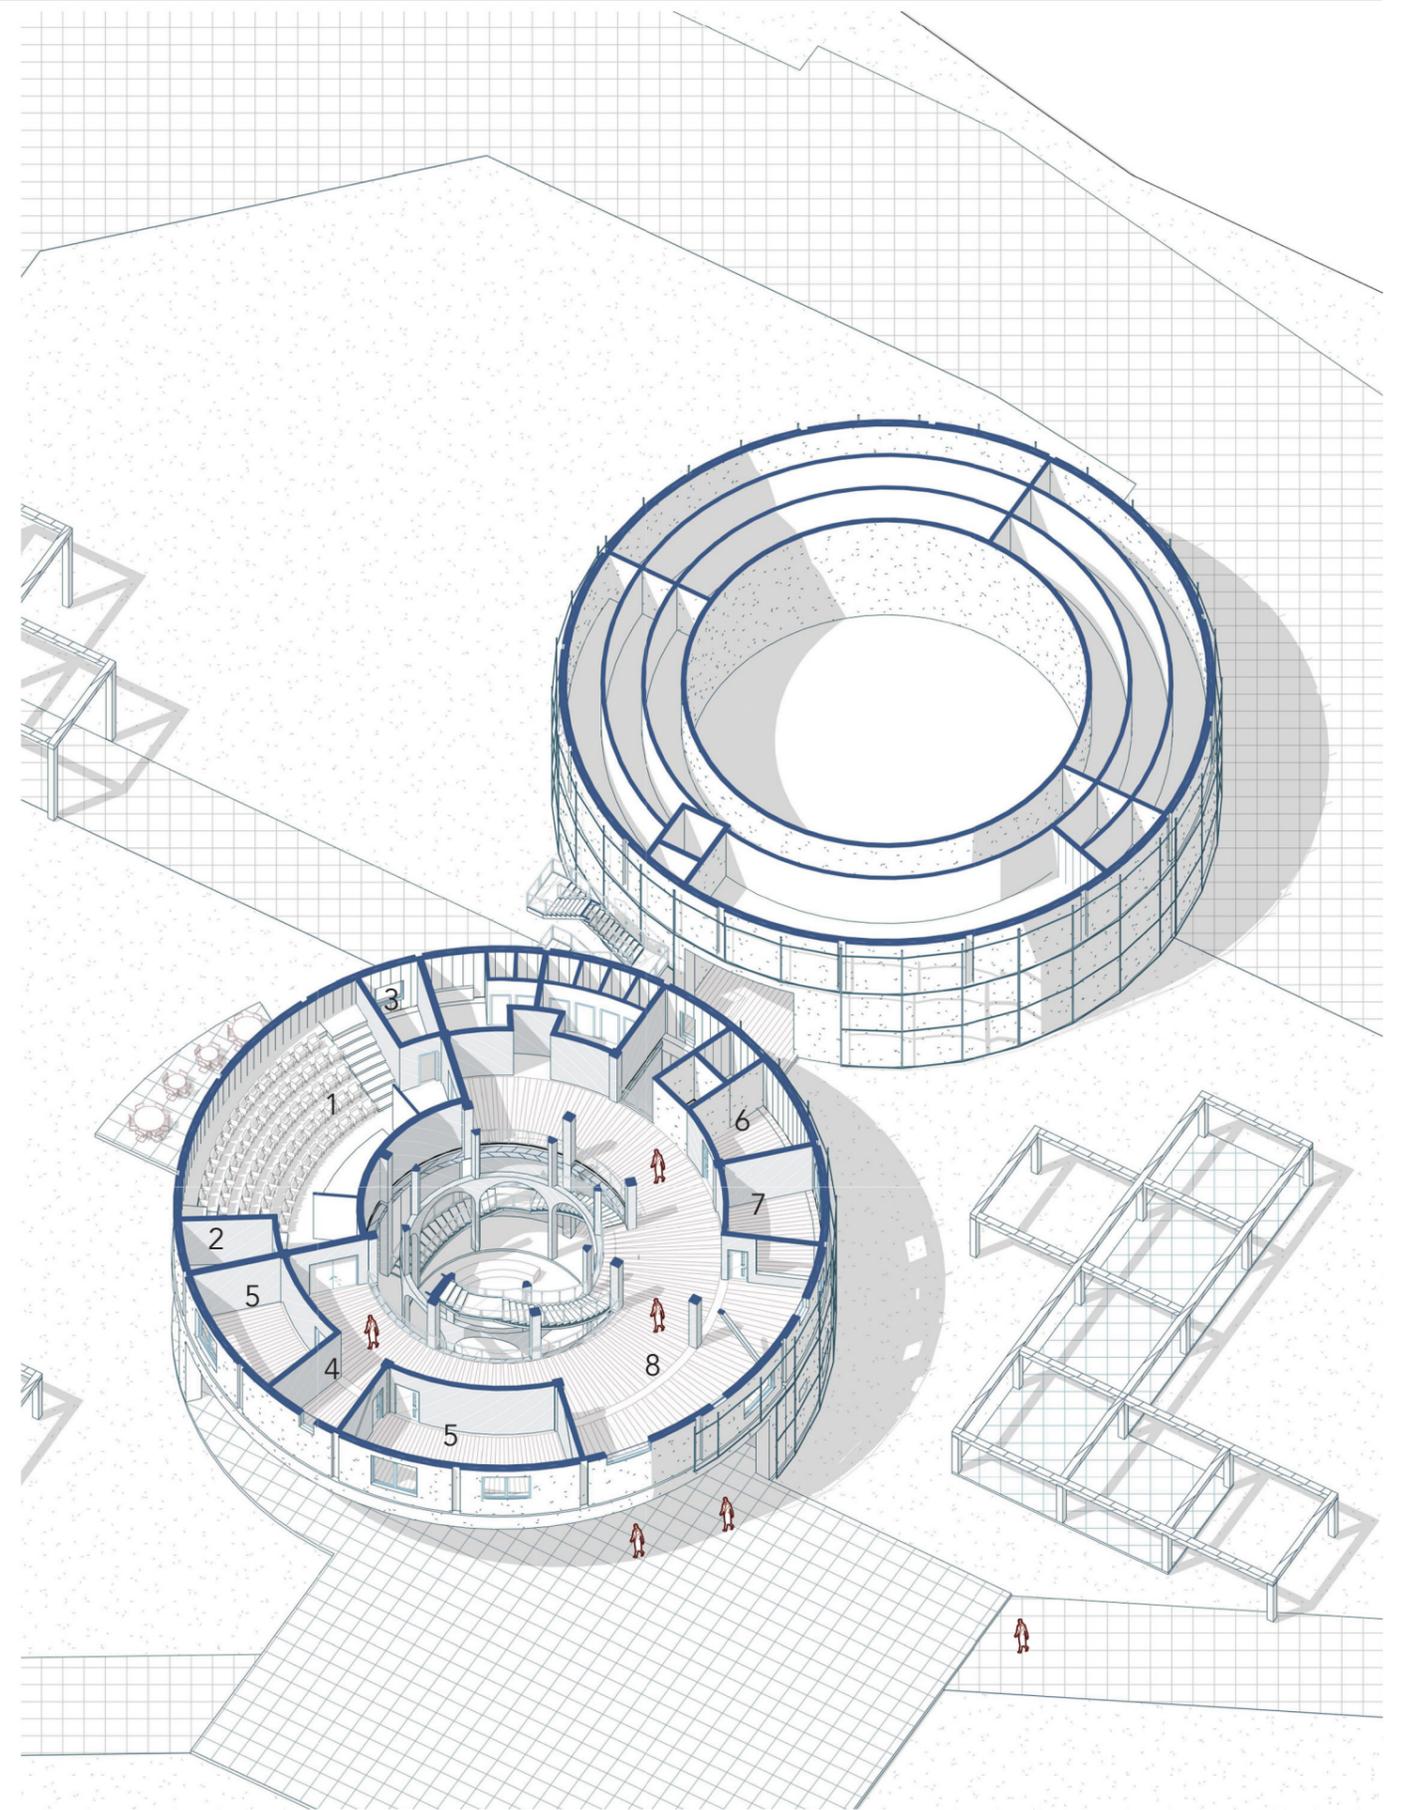

# FIRST FLOOR PLAN

Lv1 +6.0 M

First floor:

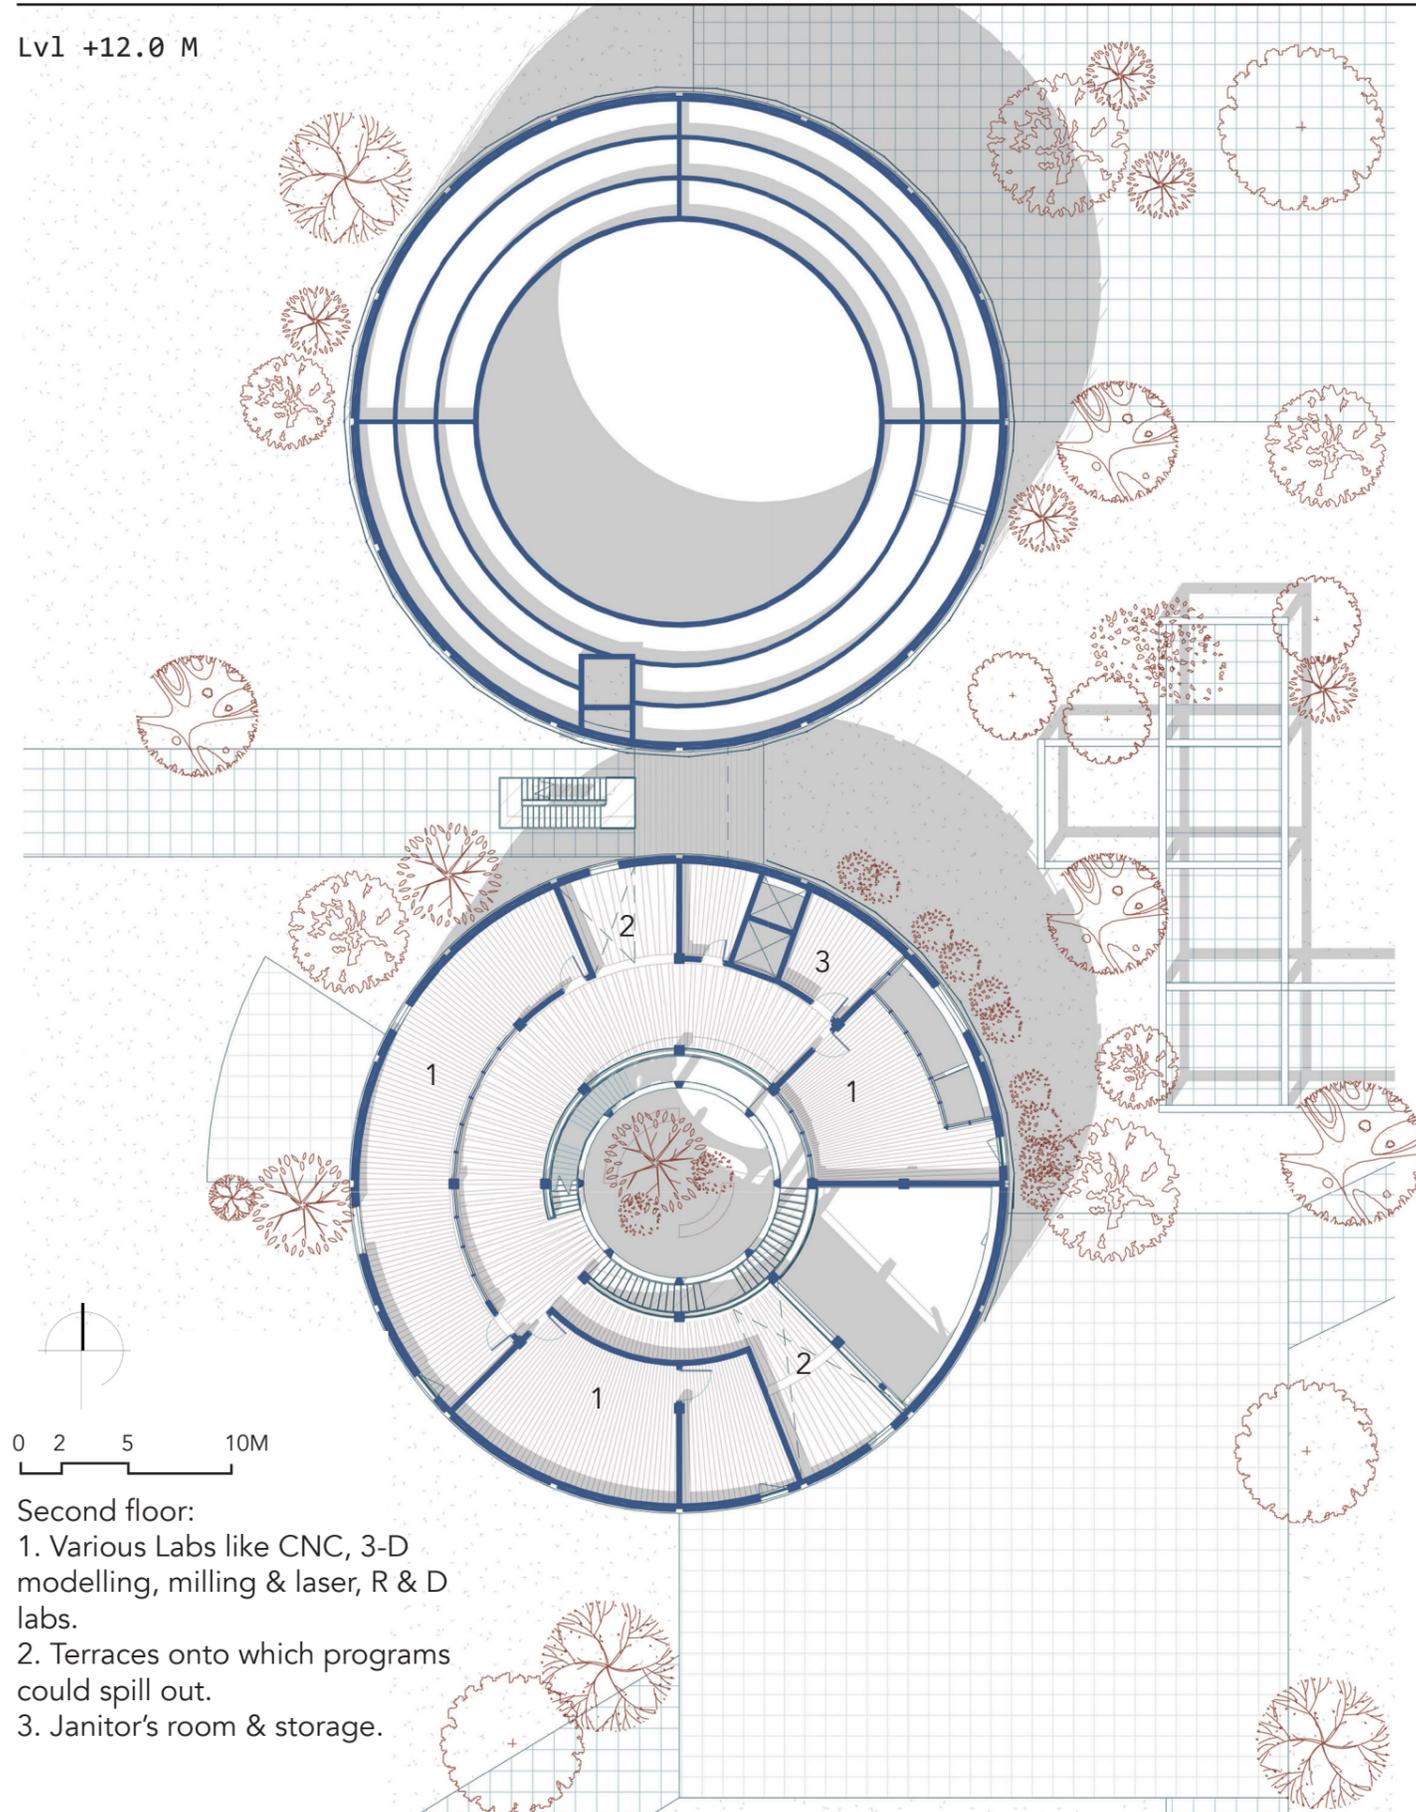

1. Auditorium for public speaking  
-100 people
2. Light and sound control room
3. AHU system for auditorium
4. Coat room
5. Help desk, Ticket area and office for auditorium
6. Hi-Fog system for Silo 1
7. Cafeteria
8. Lounge and waiting area
9. Site administration office.

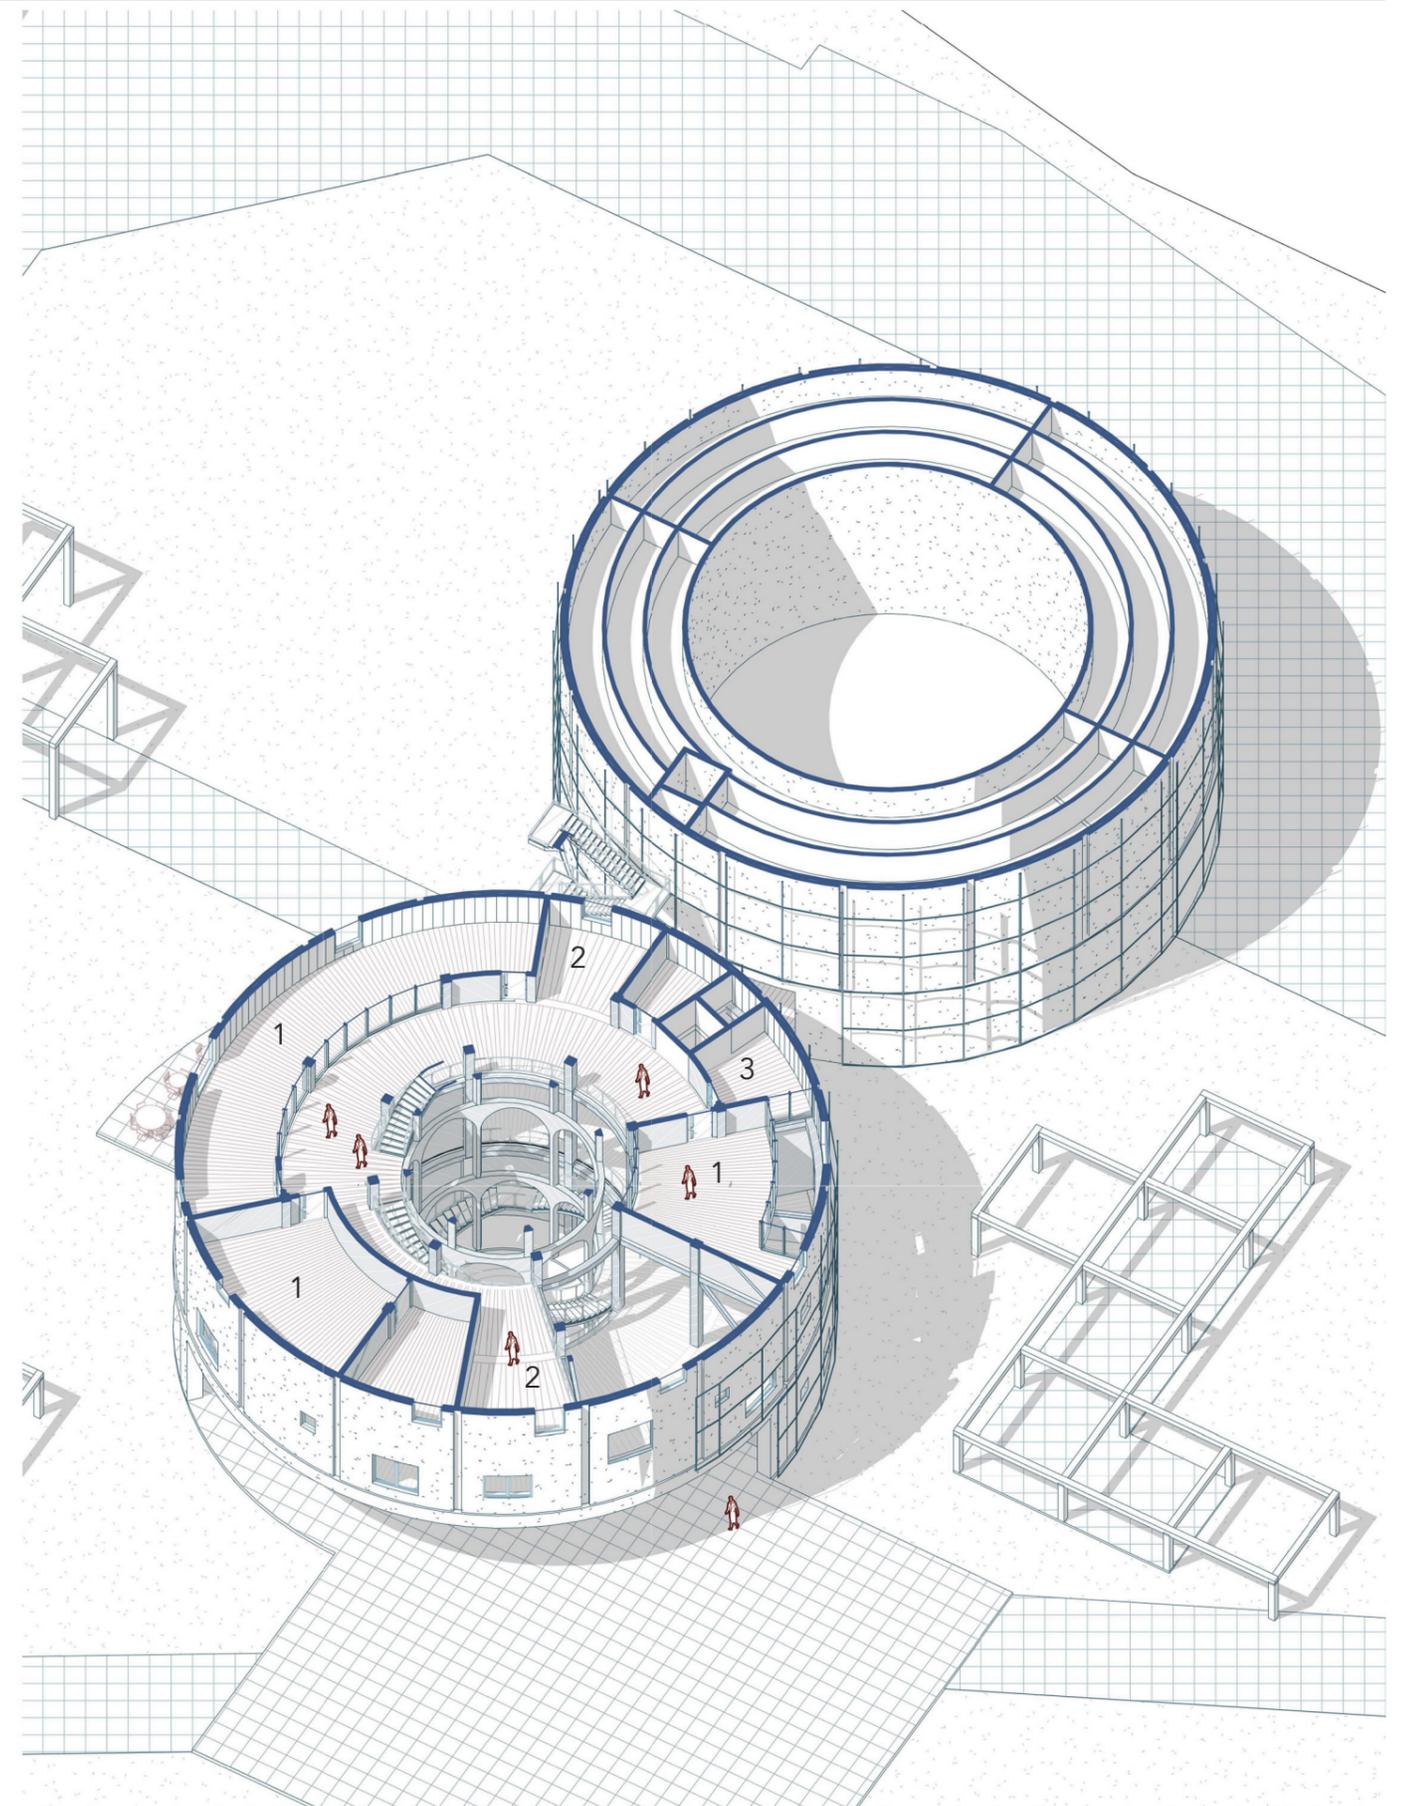

# SECOND FLOOR PLAN

Lvl +12.0 M

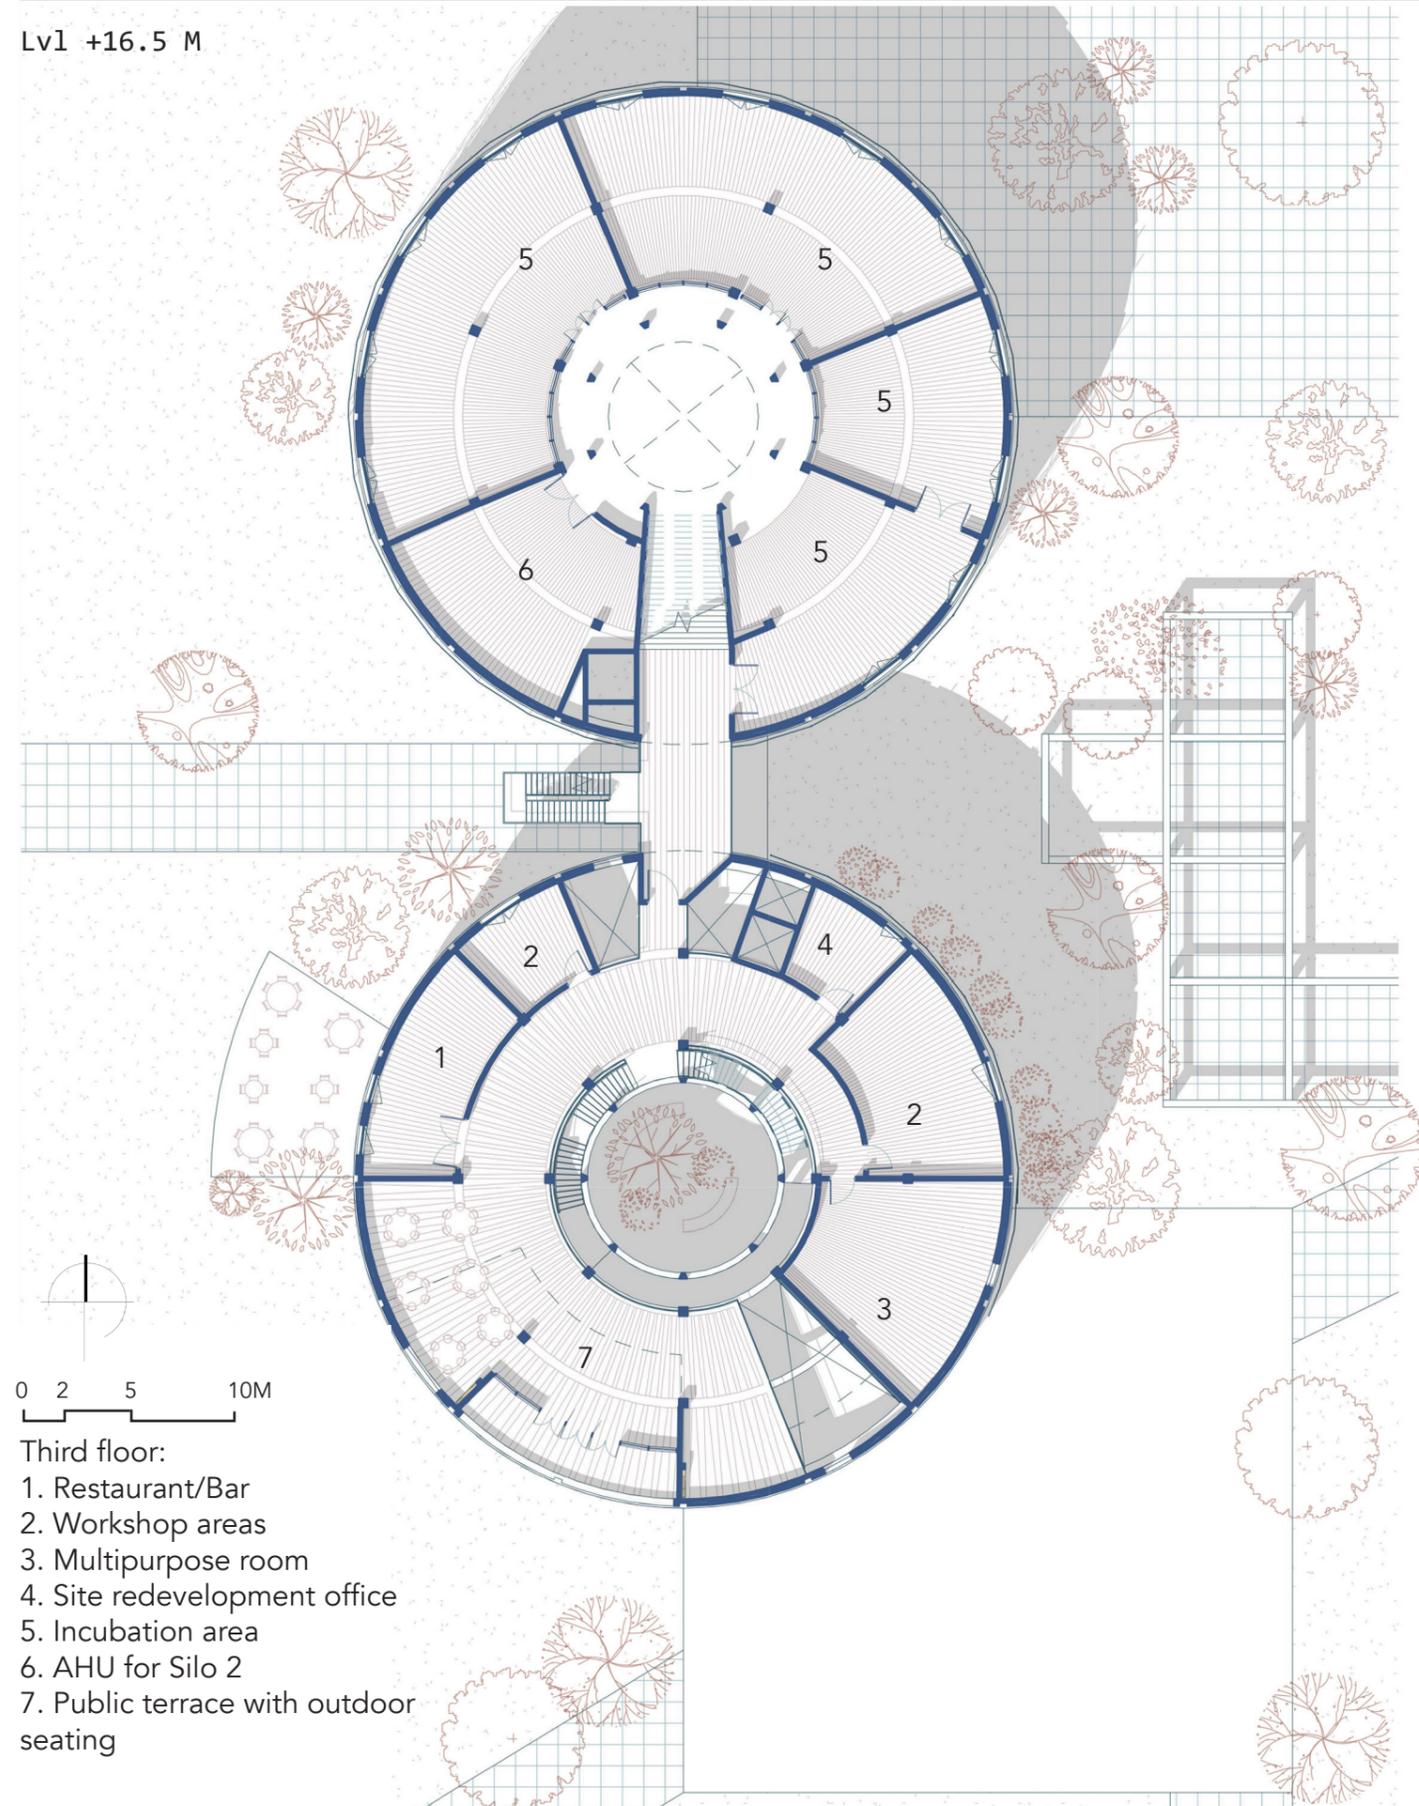

- Second floor:
1. Various Labs like CNC, 3-D modelling, milling & laser, R & D labs.
  2. Terraces onto which programs could spill out.
  3. Janitor's room & storage.

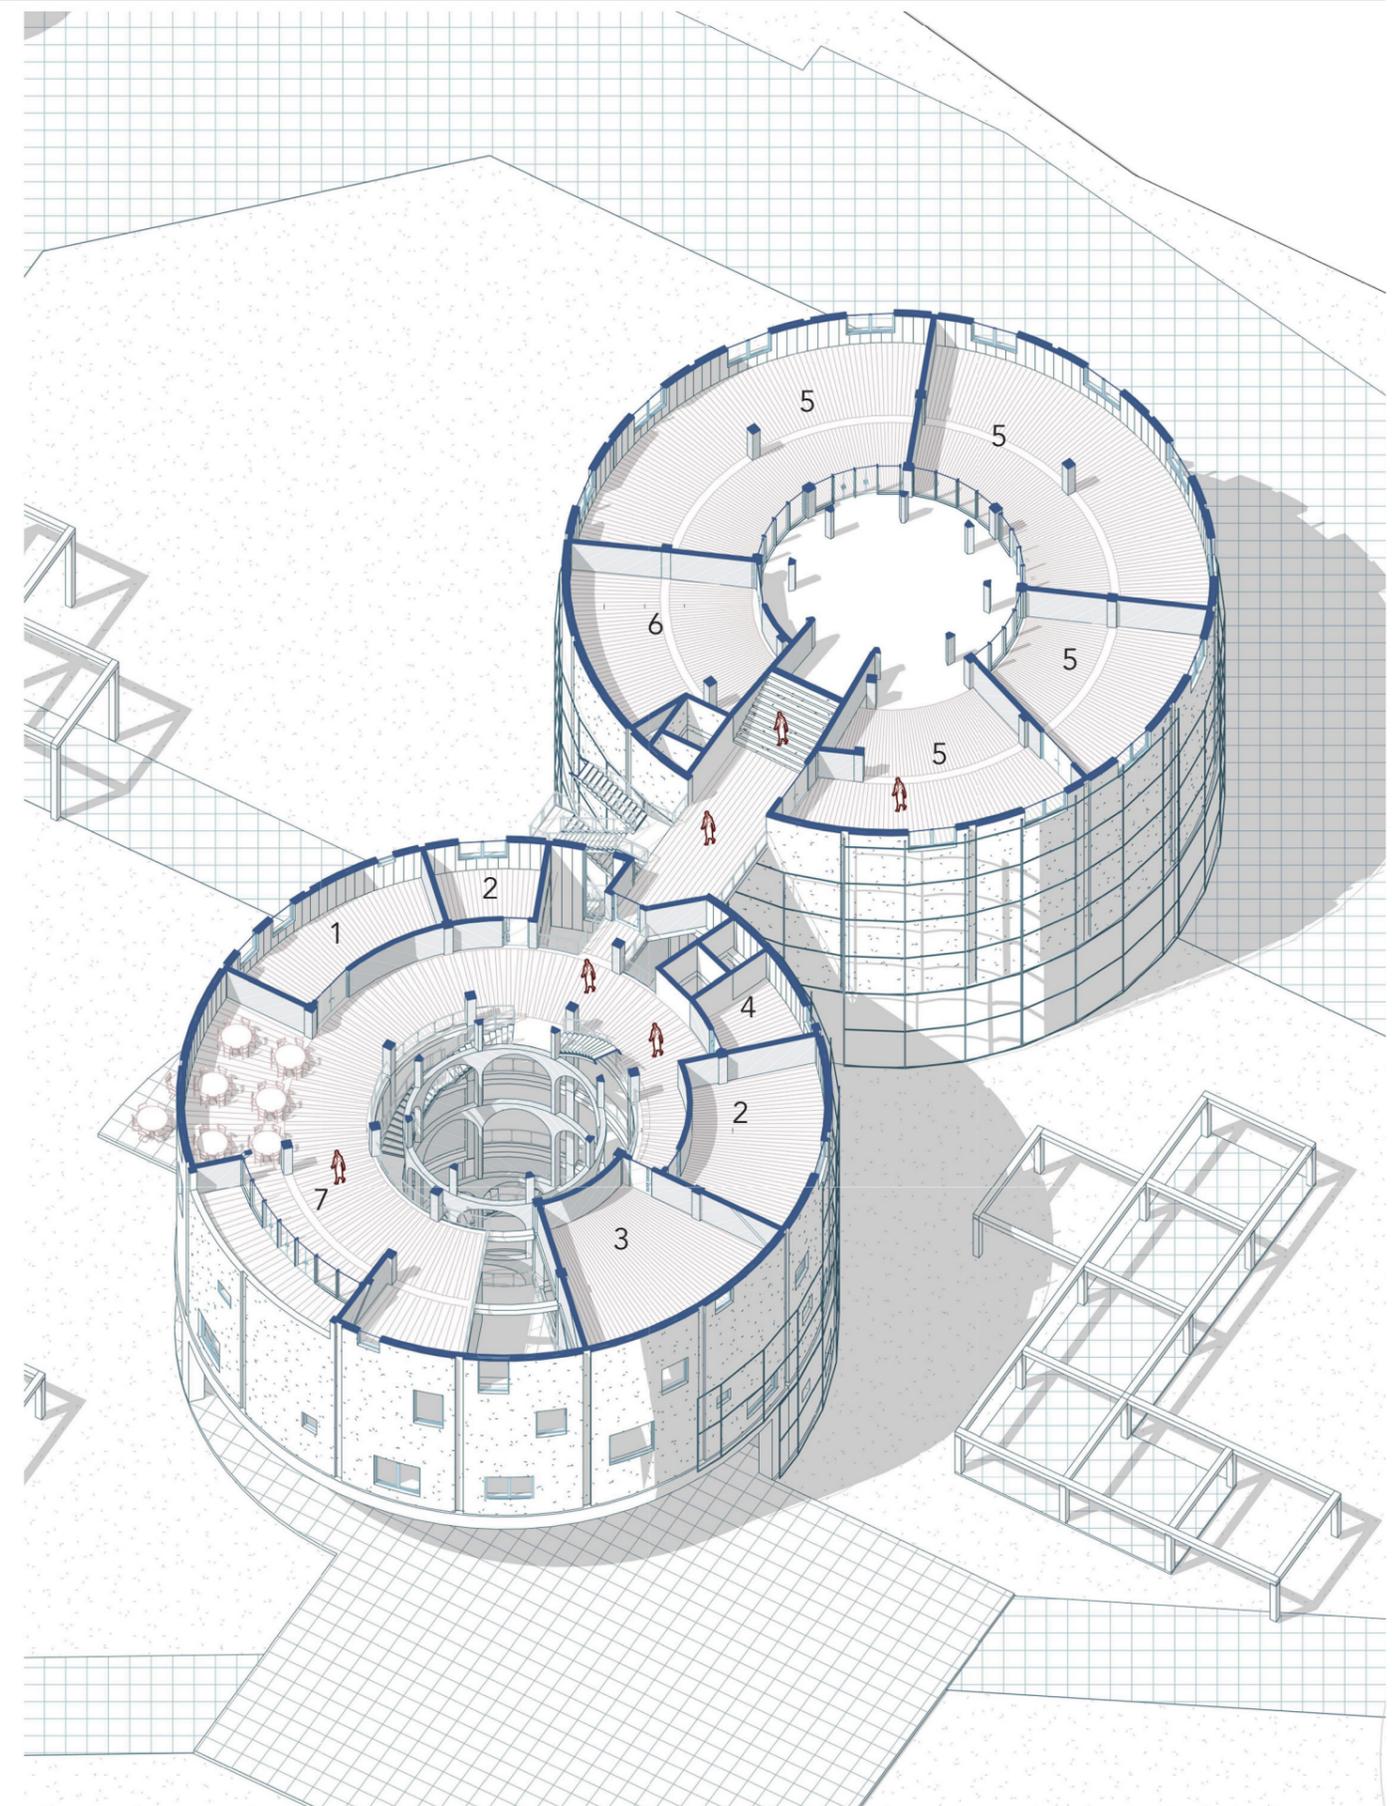

# THIRD FLOOR PLAN

Lvl +16.5 M

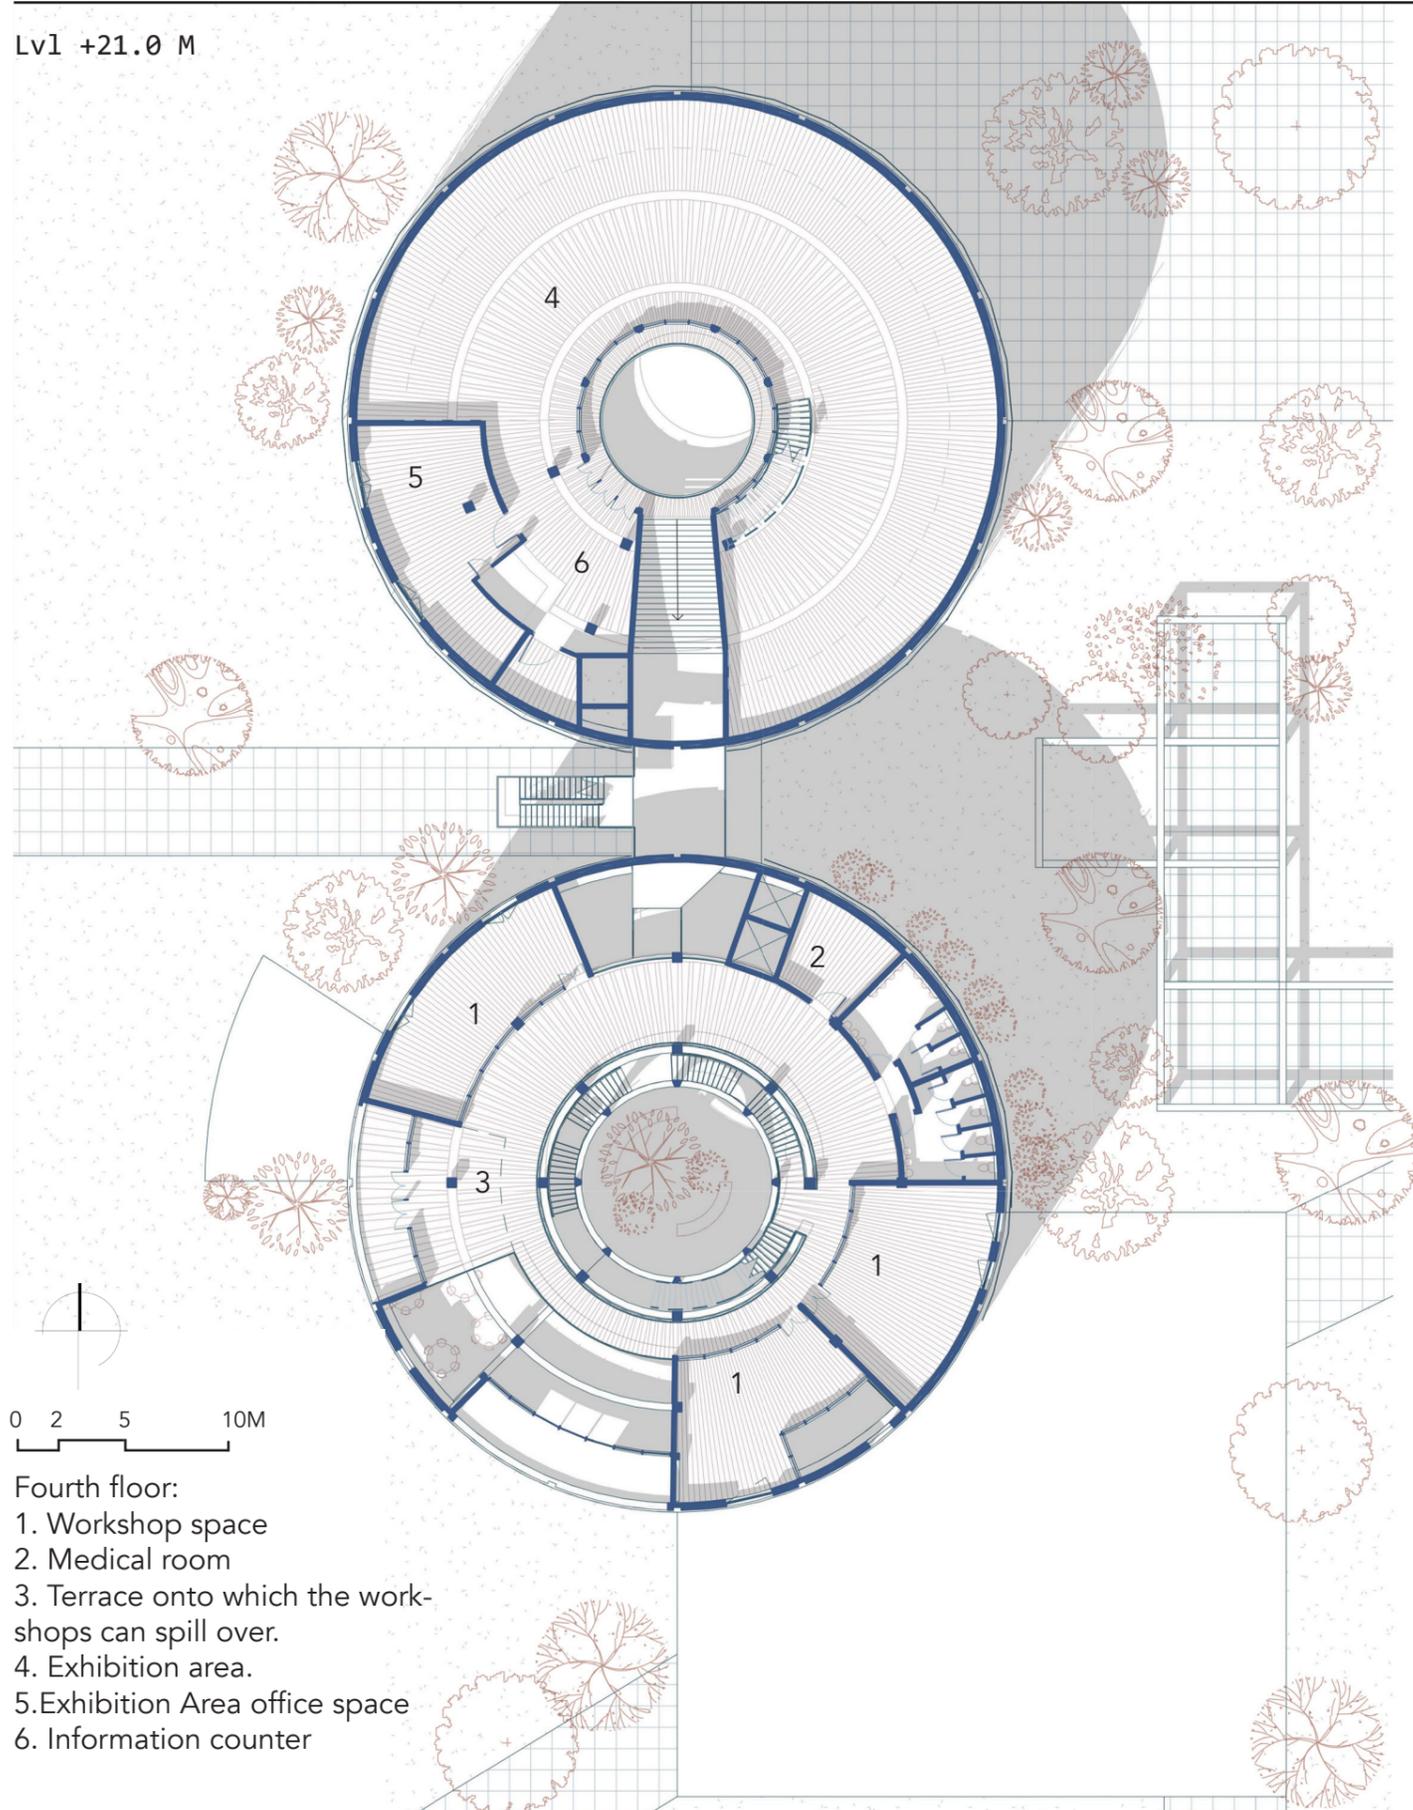

- Third floor:
- 1. Restaurant/Bar
  - 2. Workshop areas
  - 3. Multipurpose room
  - 4. Site redevelopment office
  - 5. Incubation area
  - 6. AHU for Silo 2
  - 7. Public terrace with outdoor seating

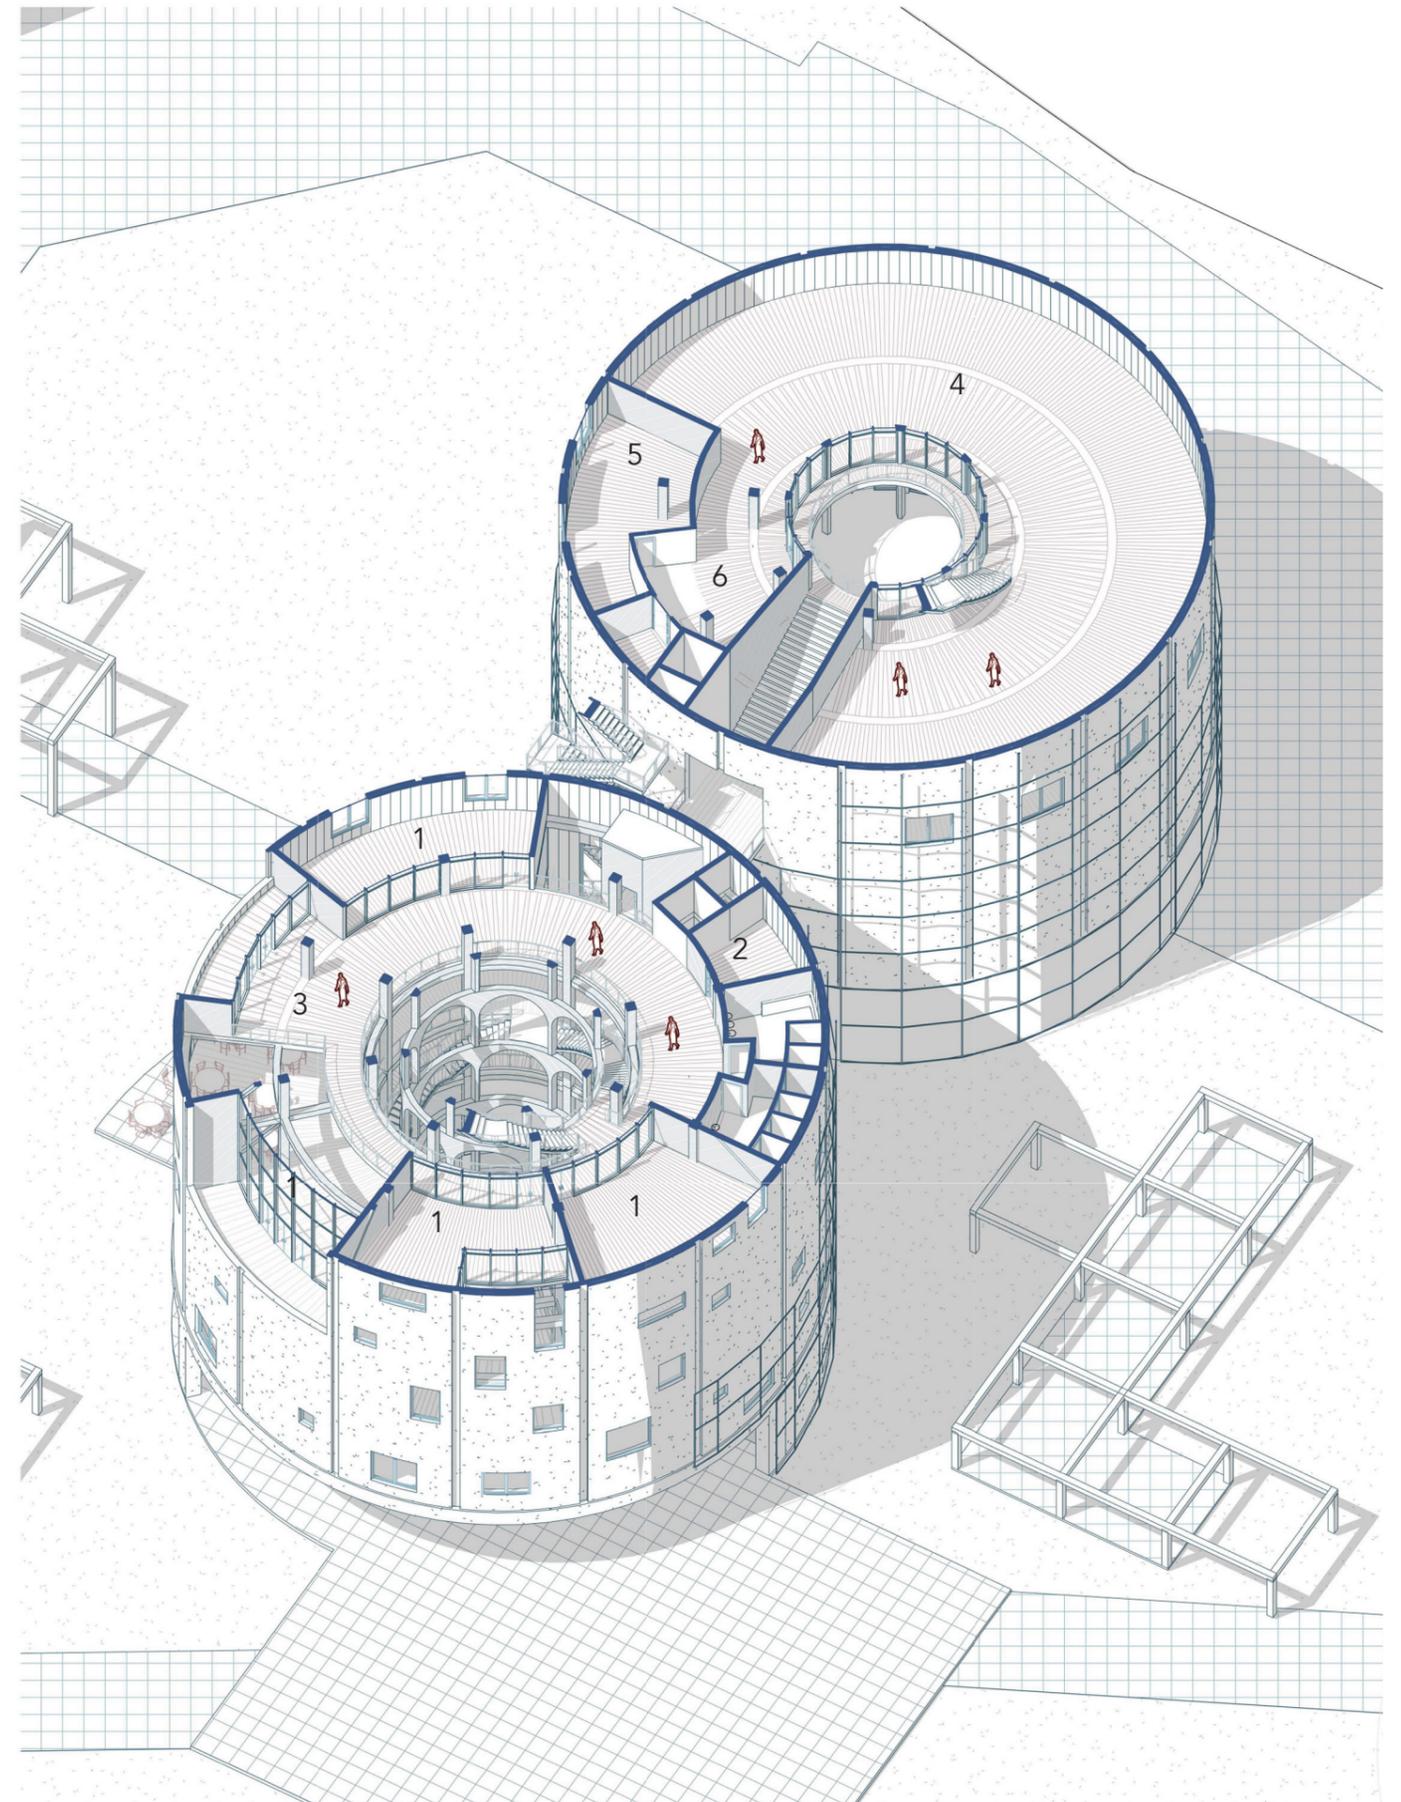

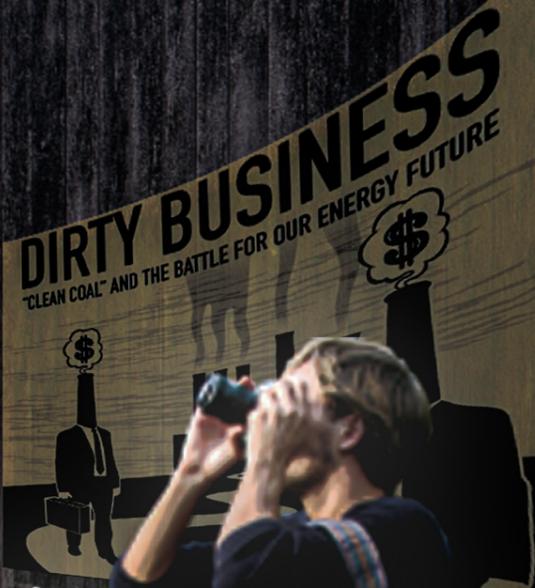

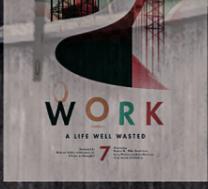

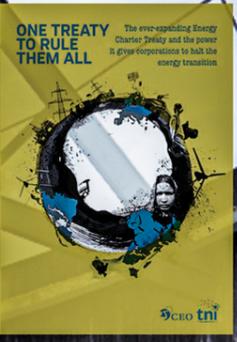

# FOURTH FLOOR PLAN

Lvl +21.0 M

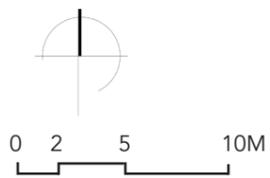

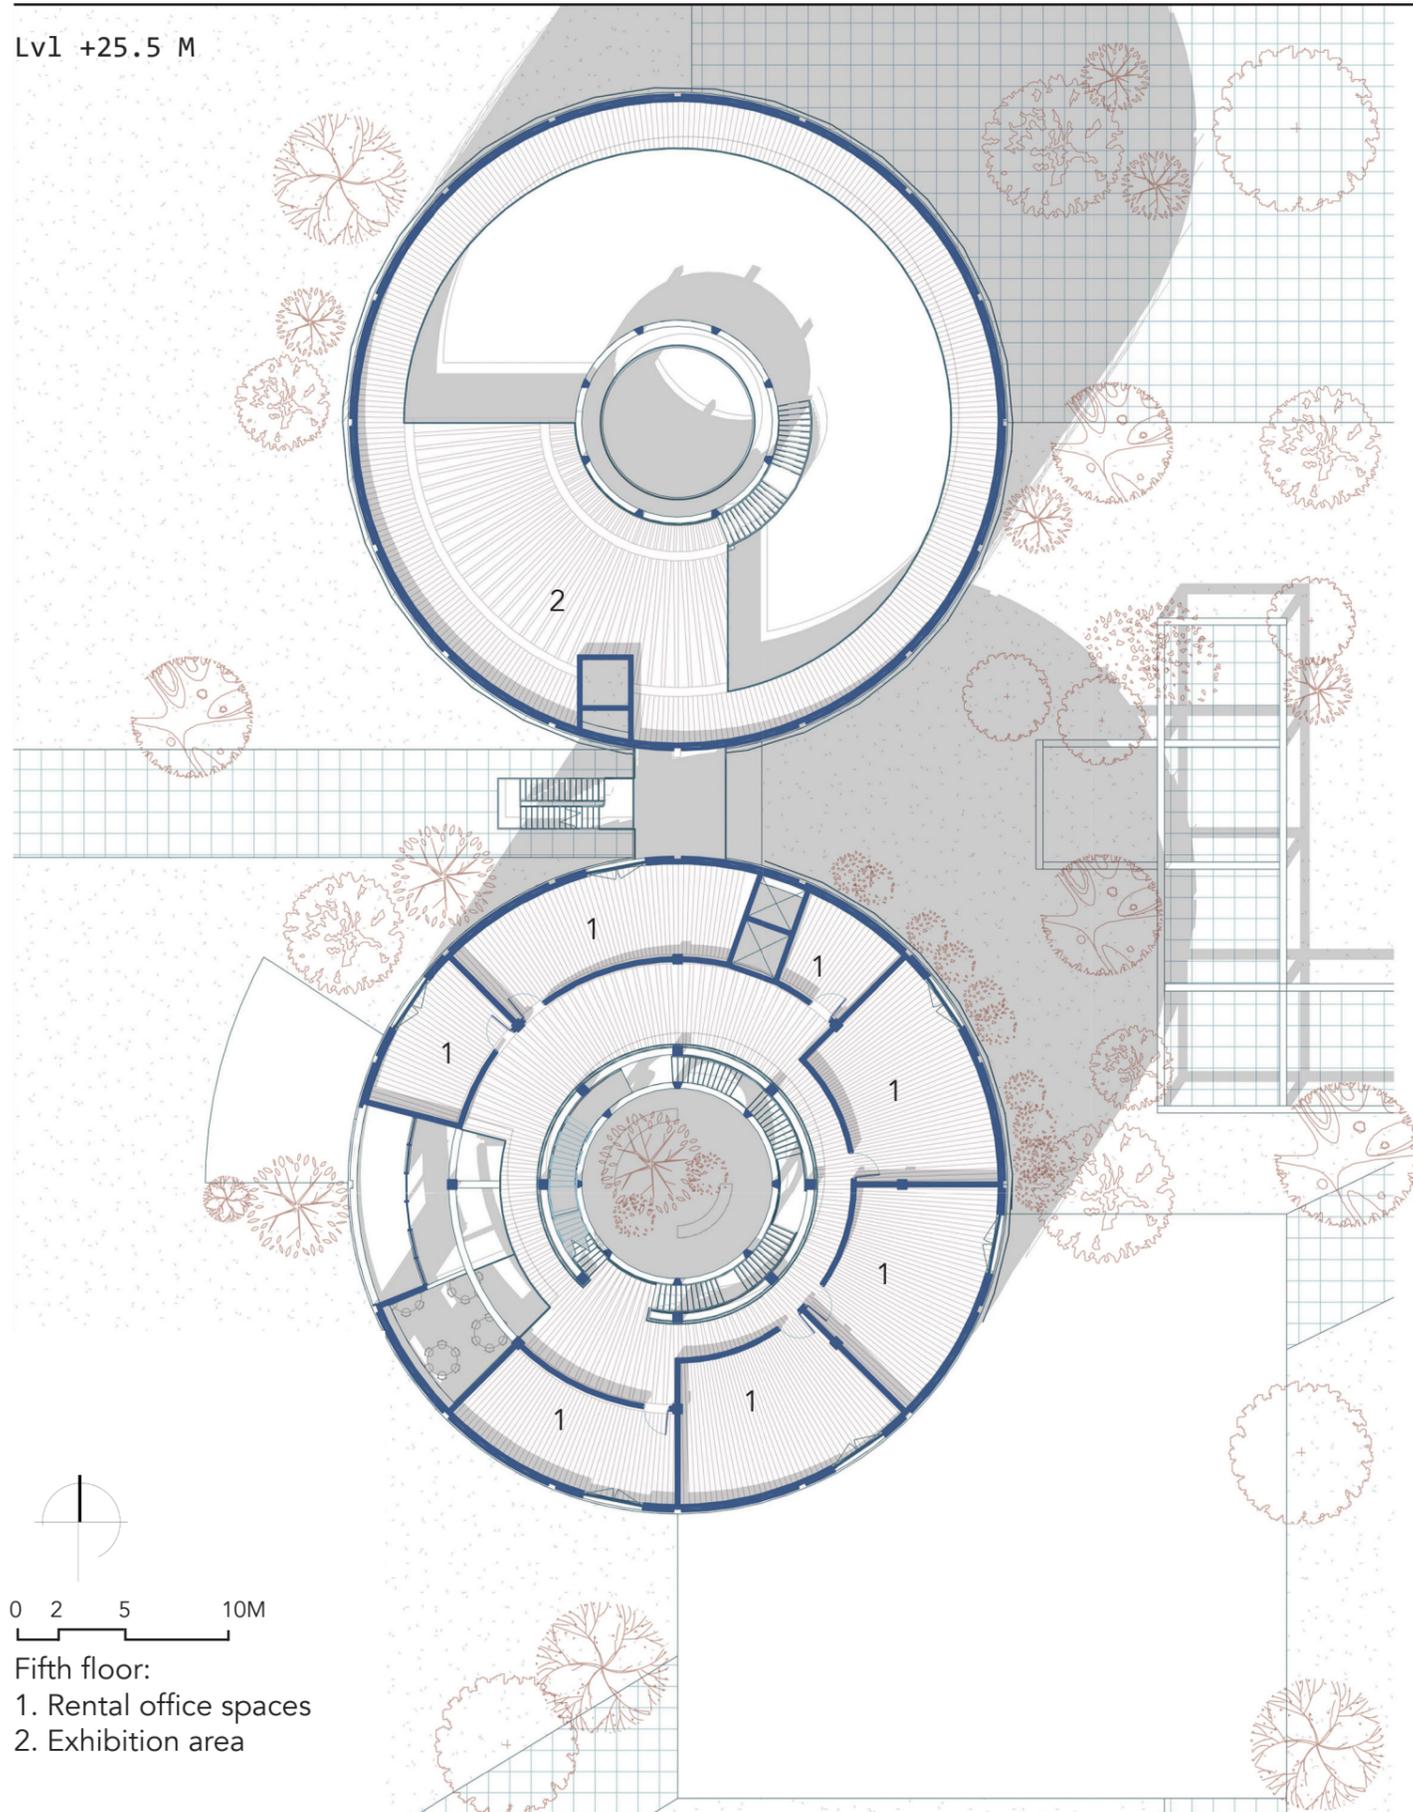

- Fourth floor:
- 1. Workshop space
  - 2. Medical room
  - 3. Terrace onto which the work-shops can spill over.
  - 4. Exhibition area.
  - 5. Exhibition Area office space
  - 6. Information counter

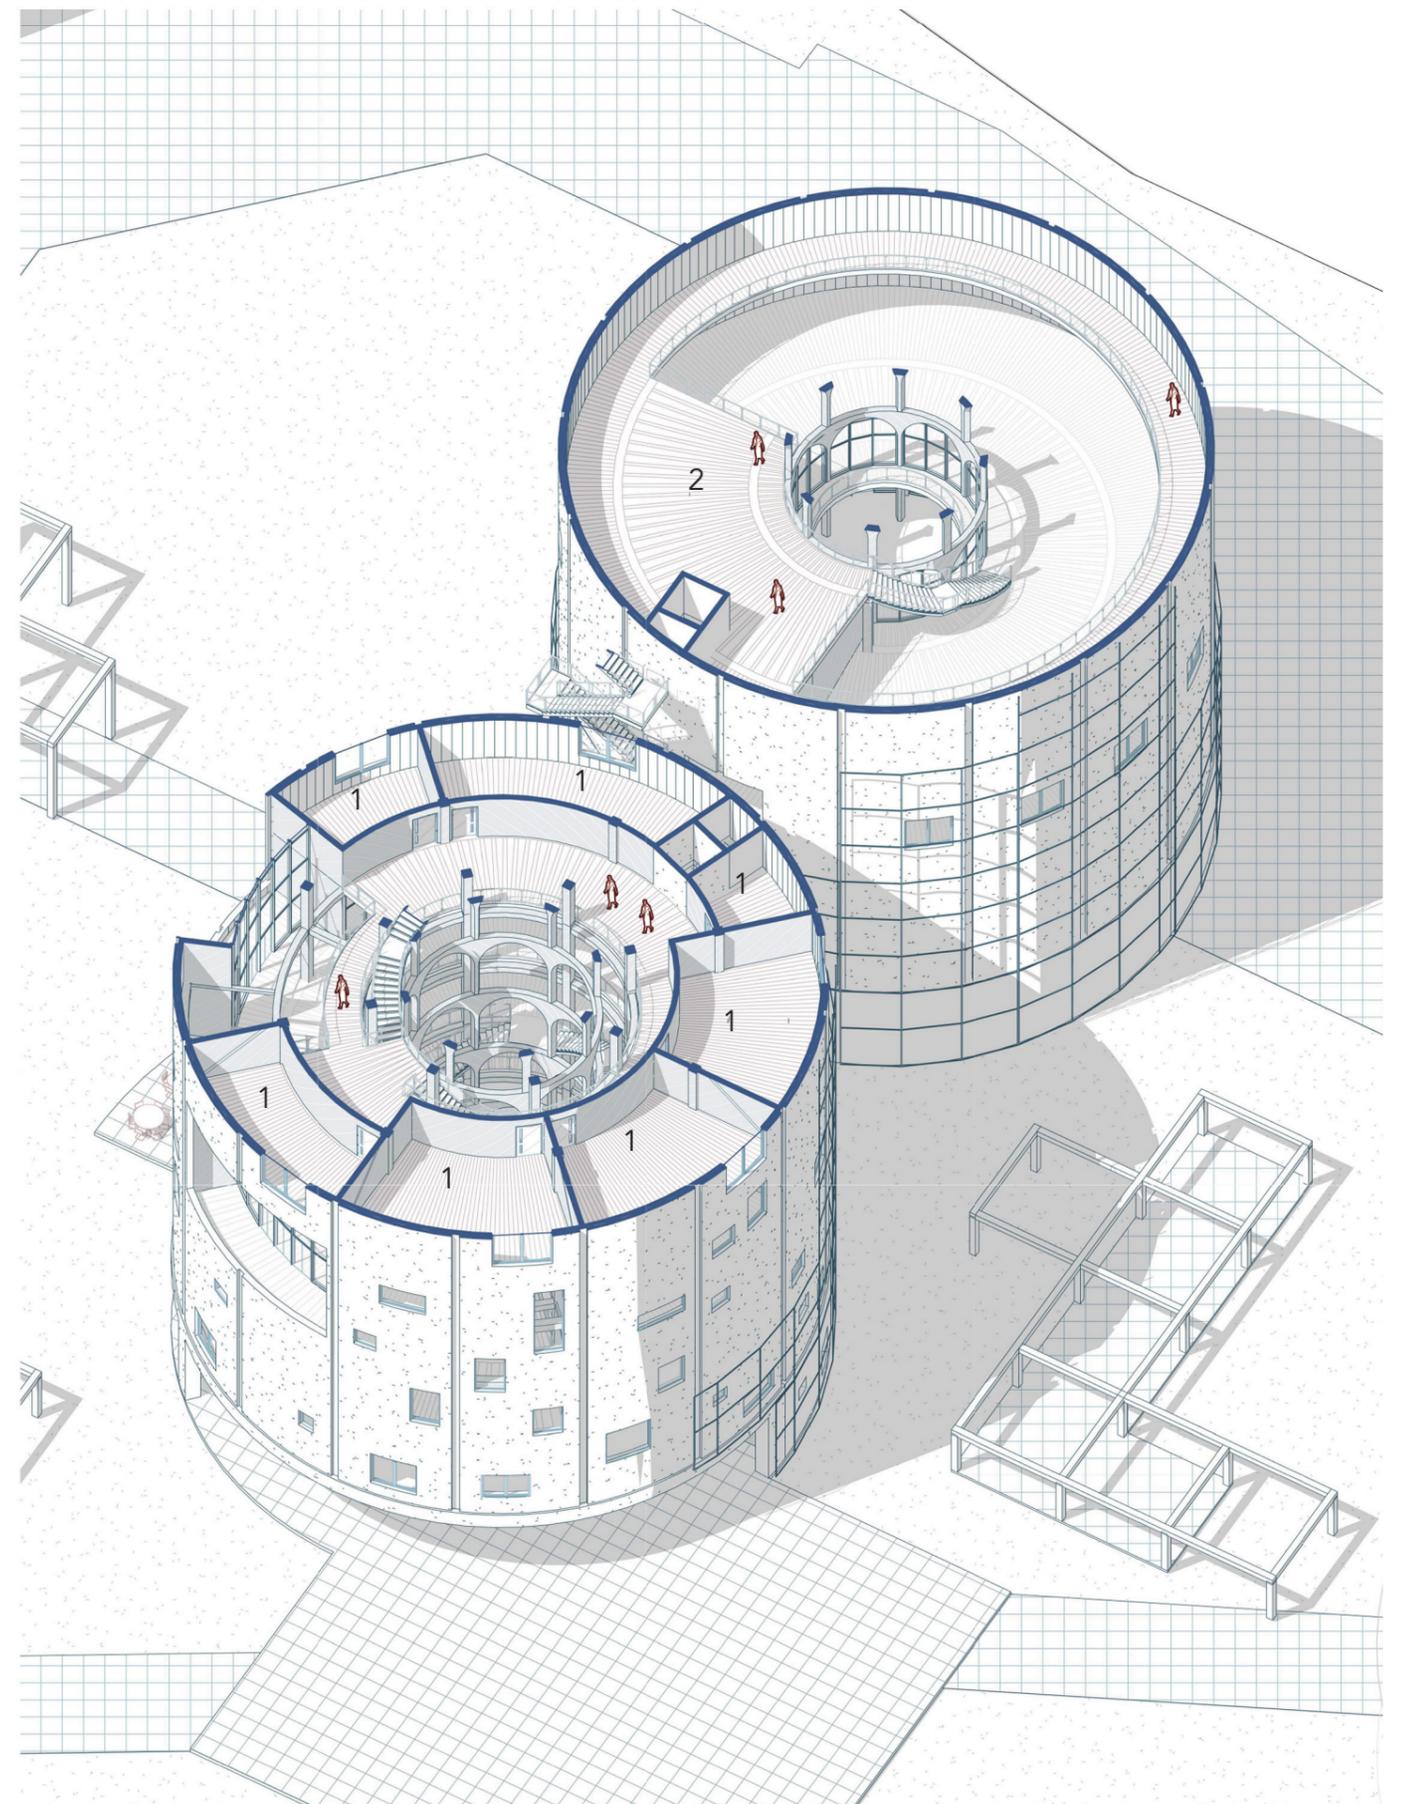

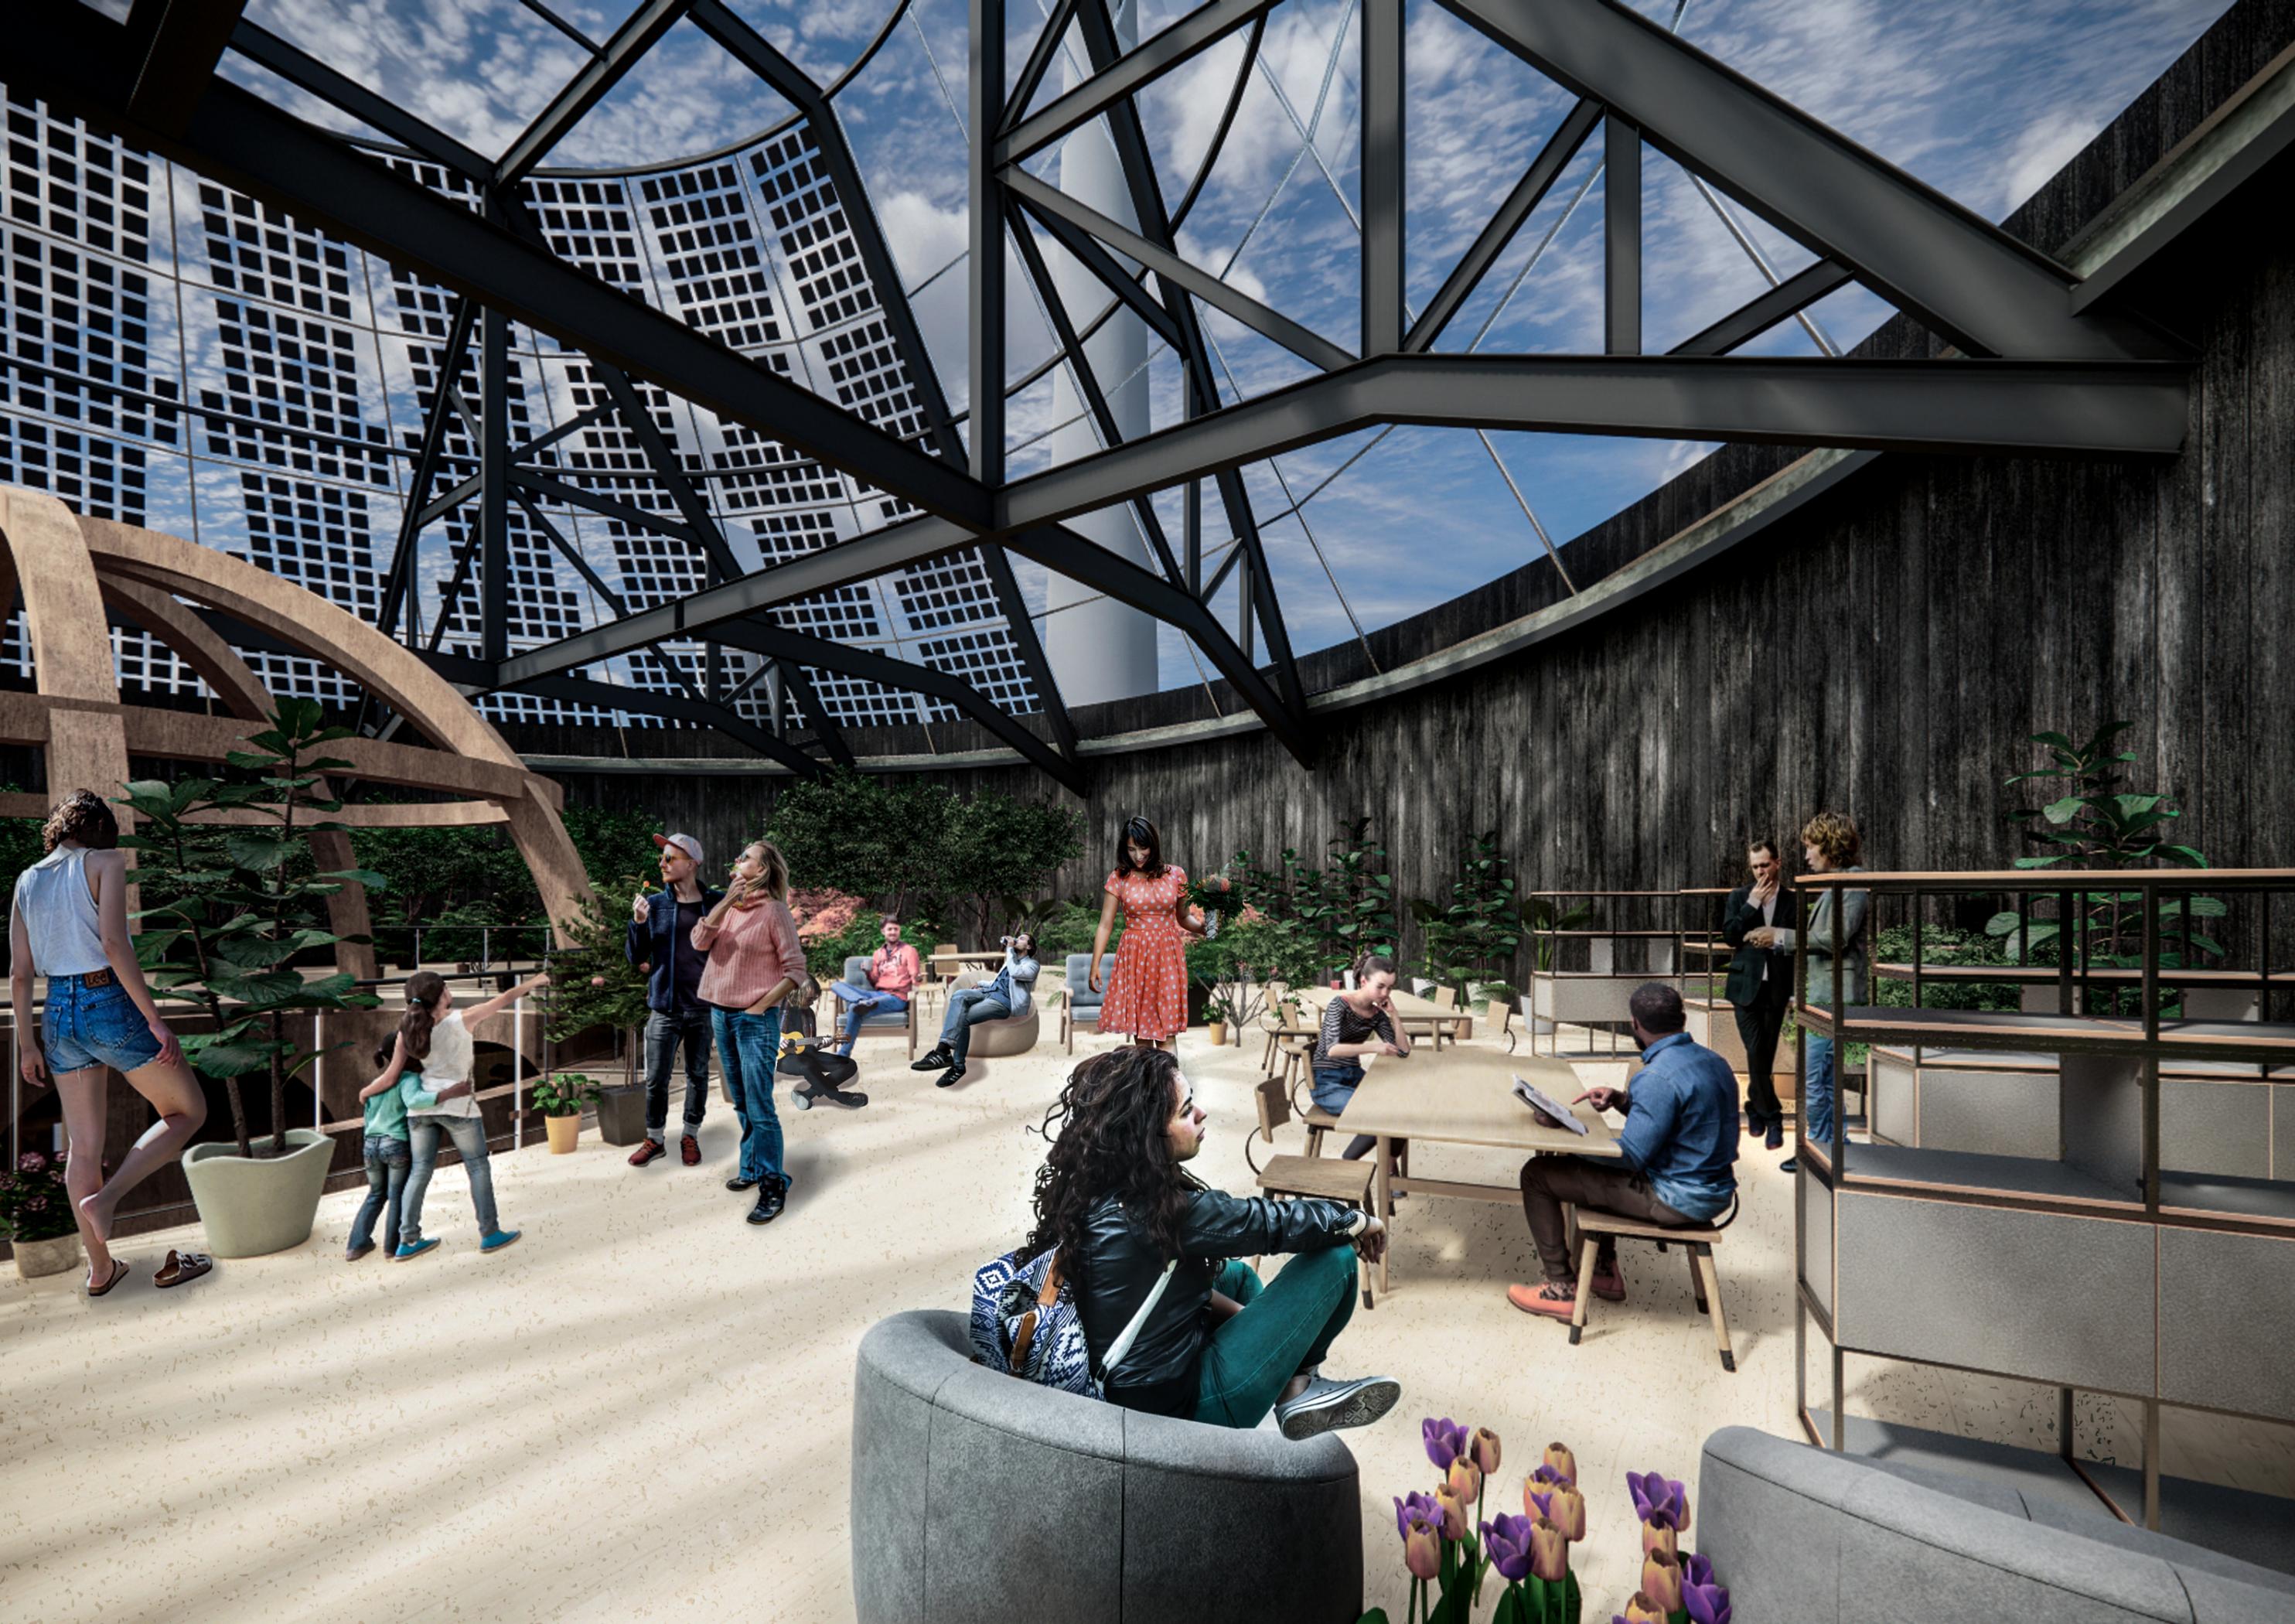

# FIFTH FLOOR PLAN

Lvl +25.5 M

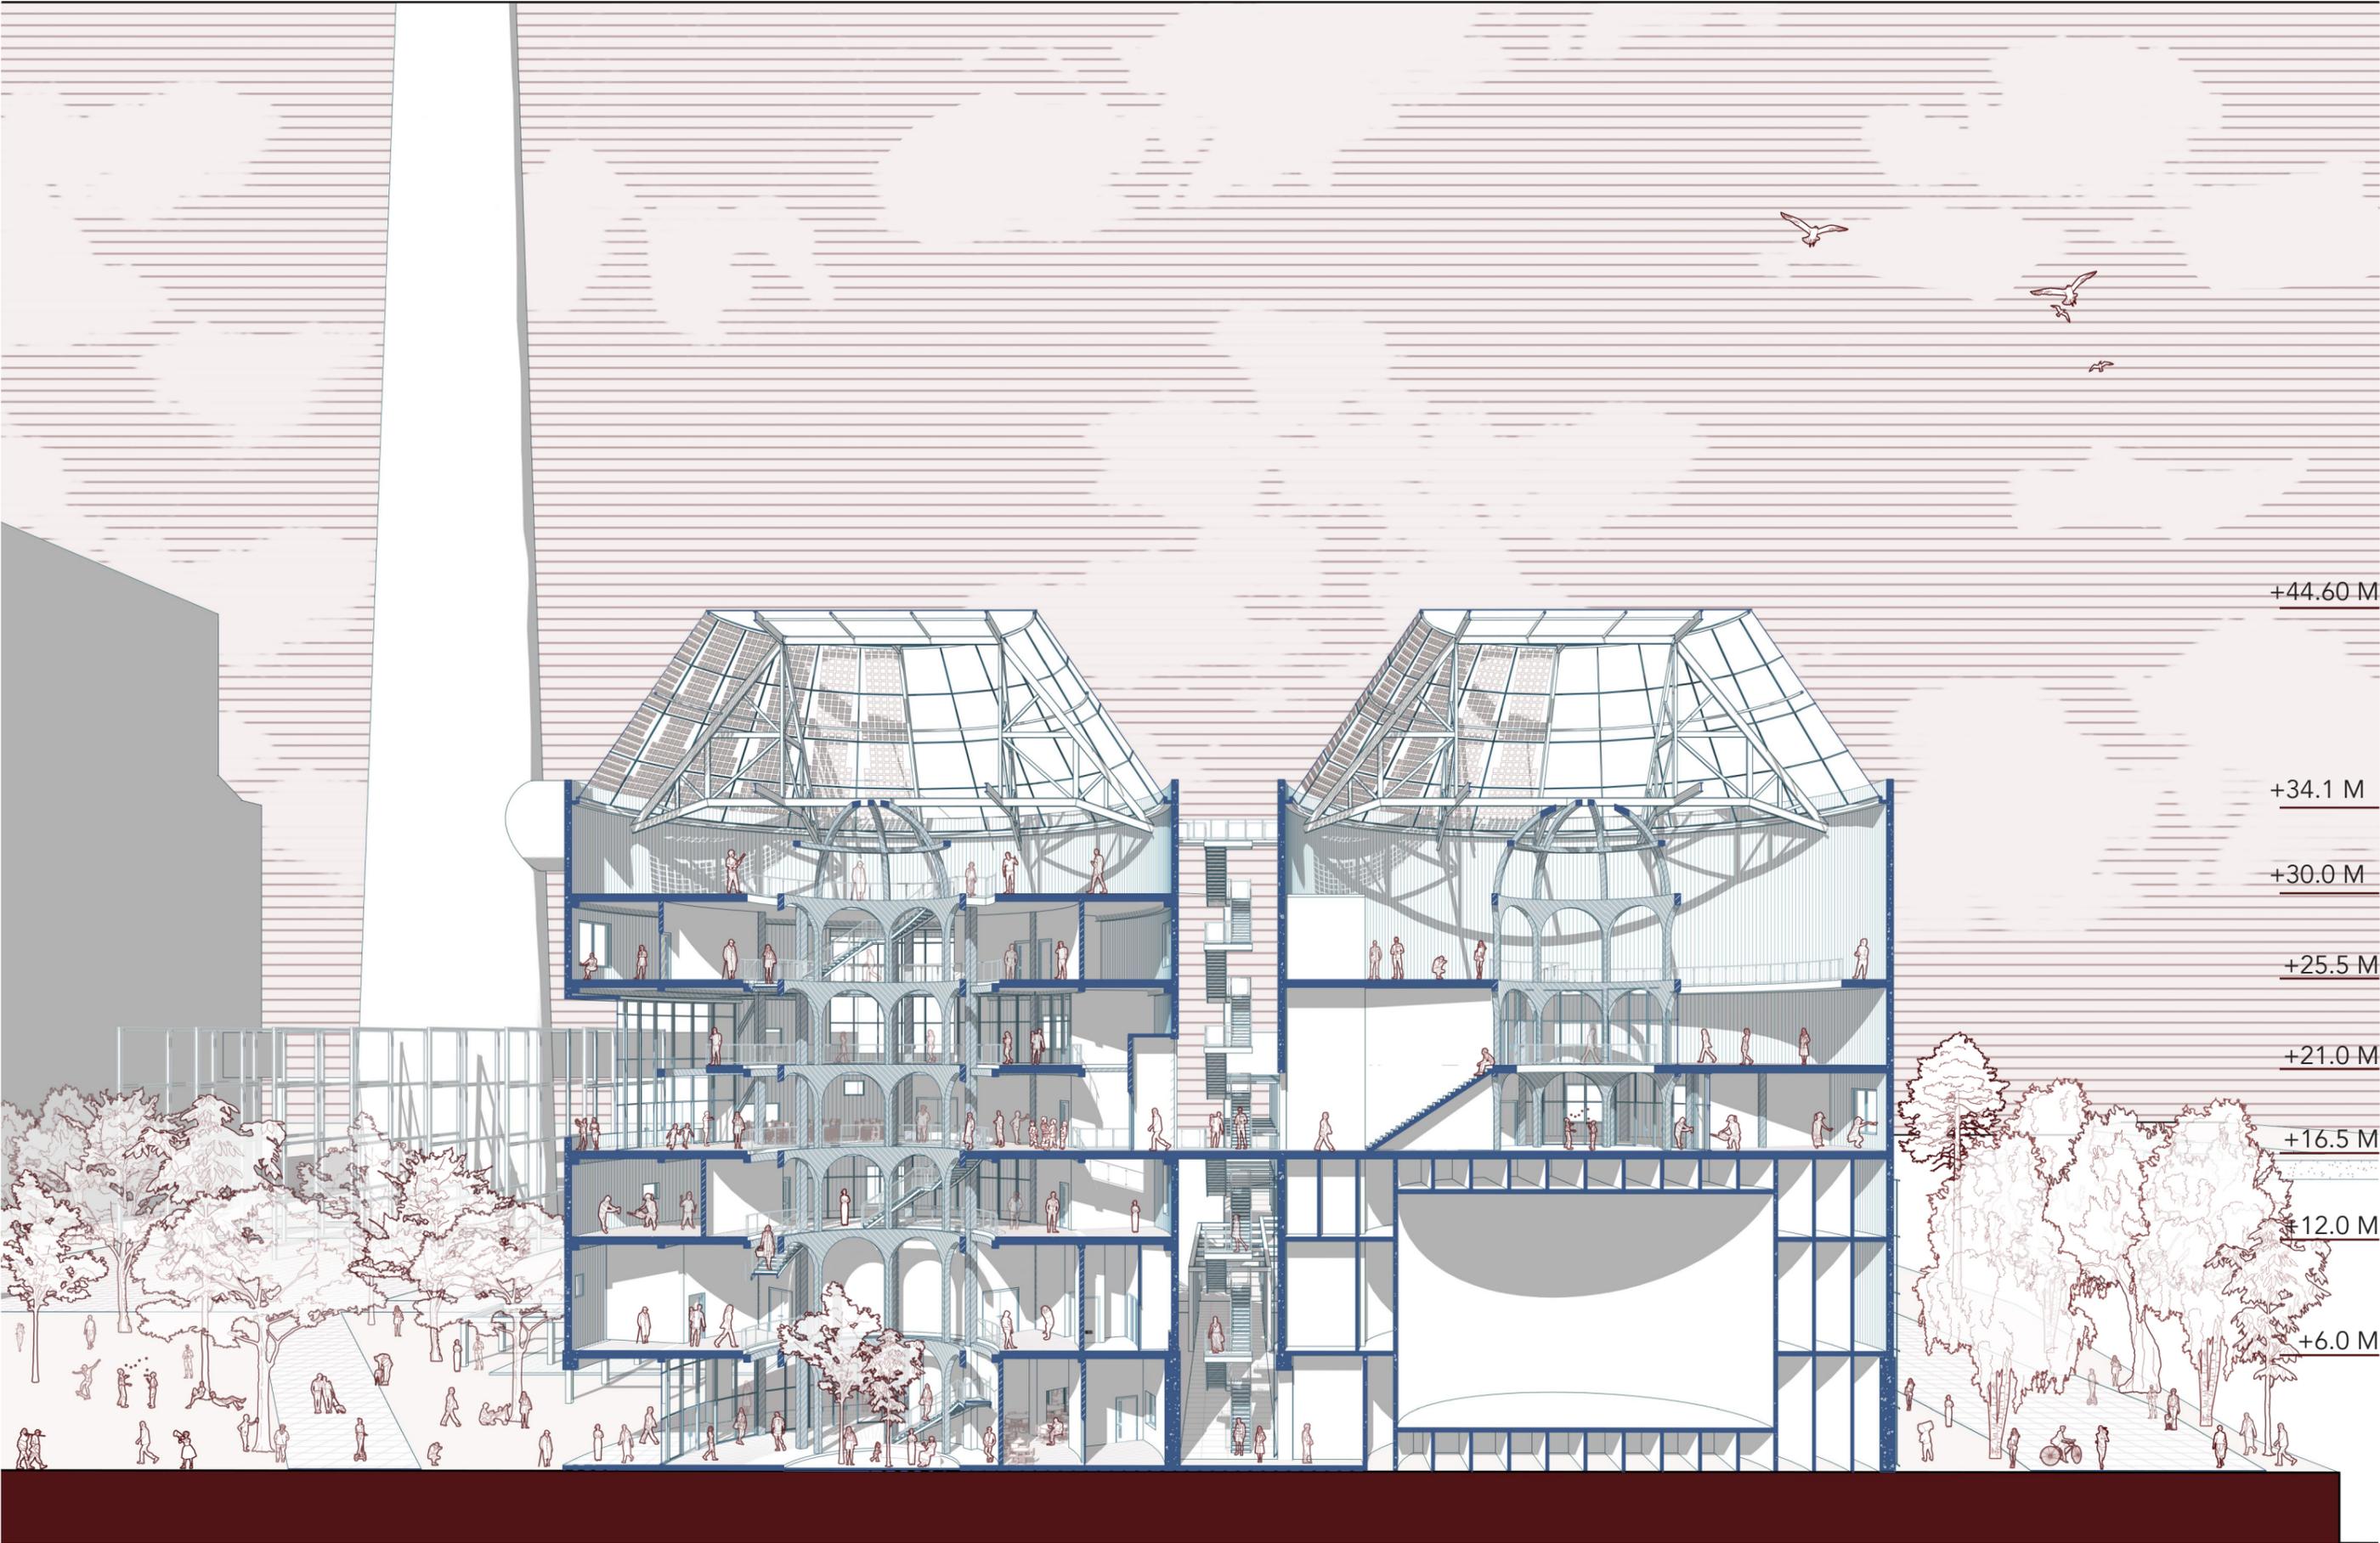

Fifth floor:  
1. Rental office spaces  
2. Exhibition area

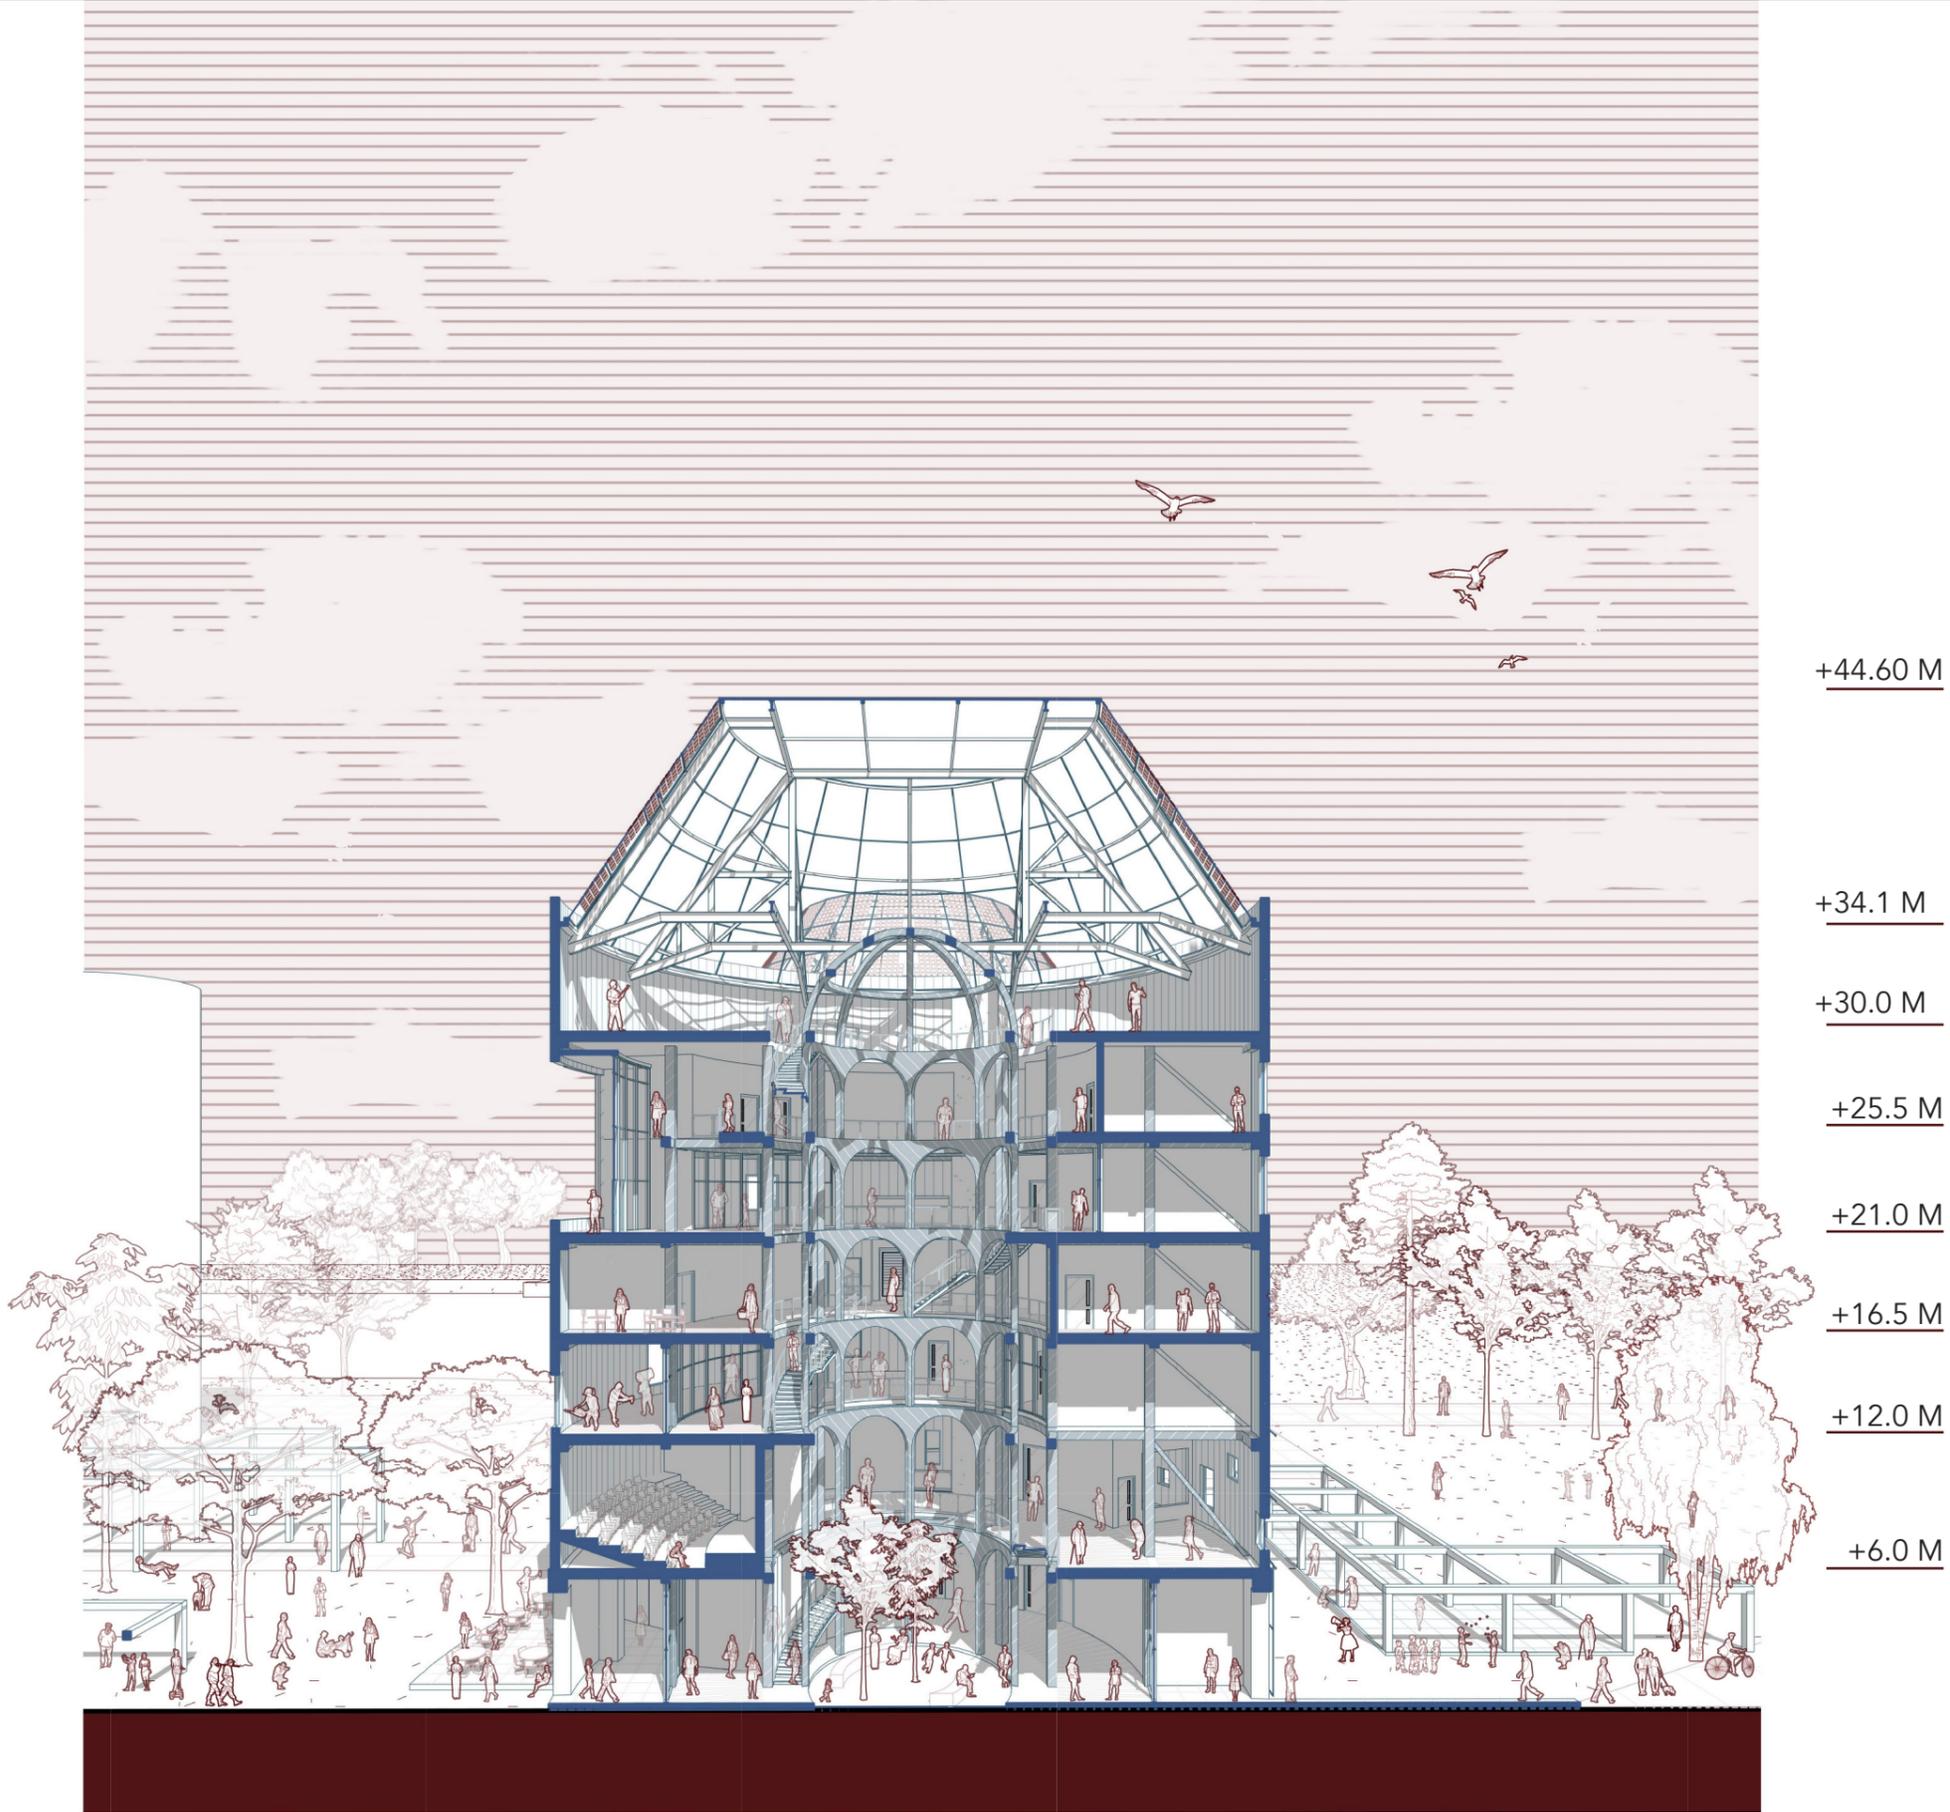

# SECTIONAL PERSPECTIVE

# SECTIONAL PERSPECTIVE

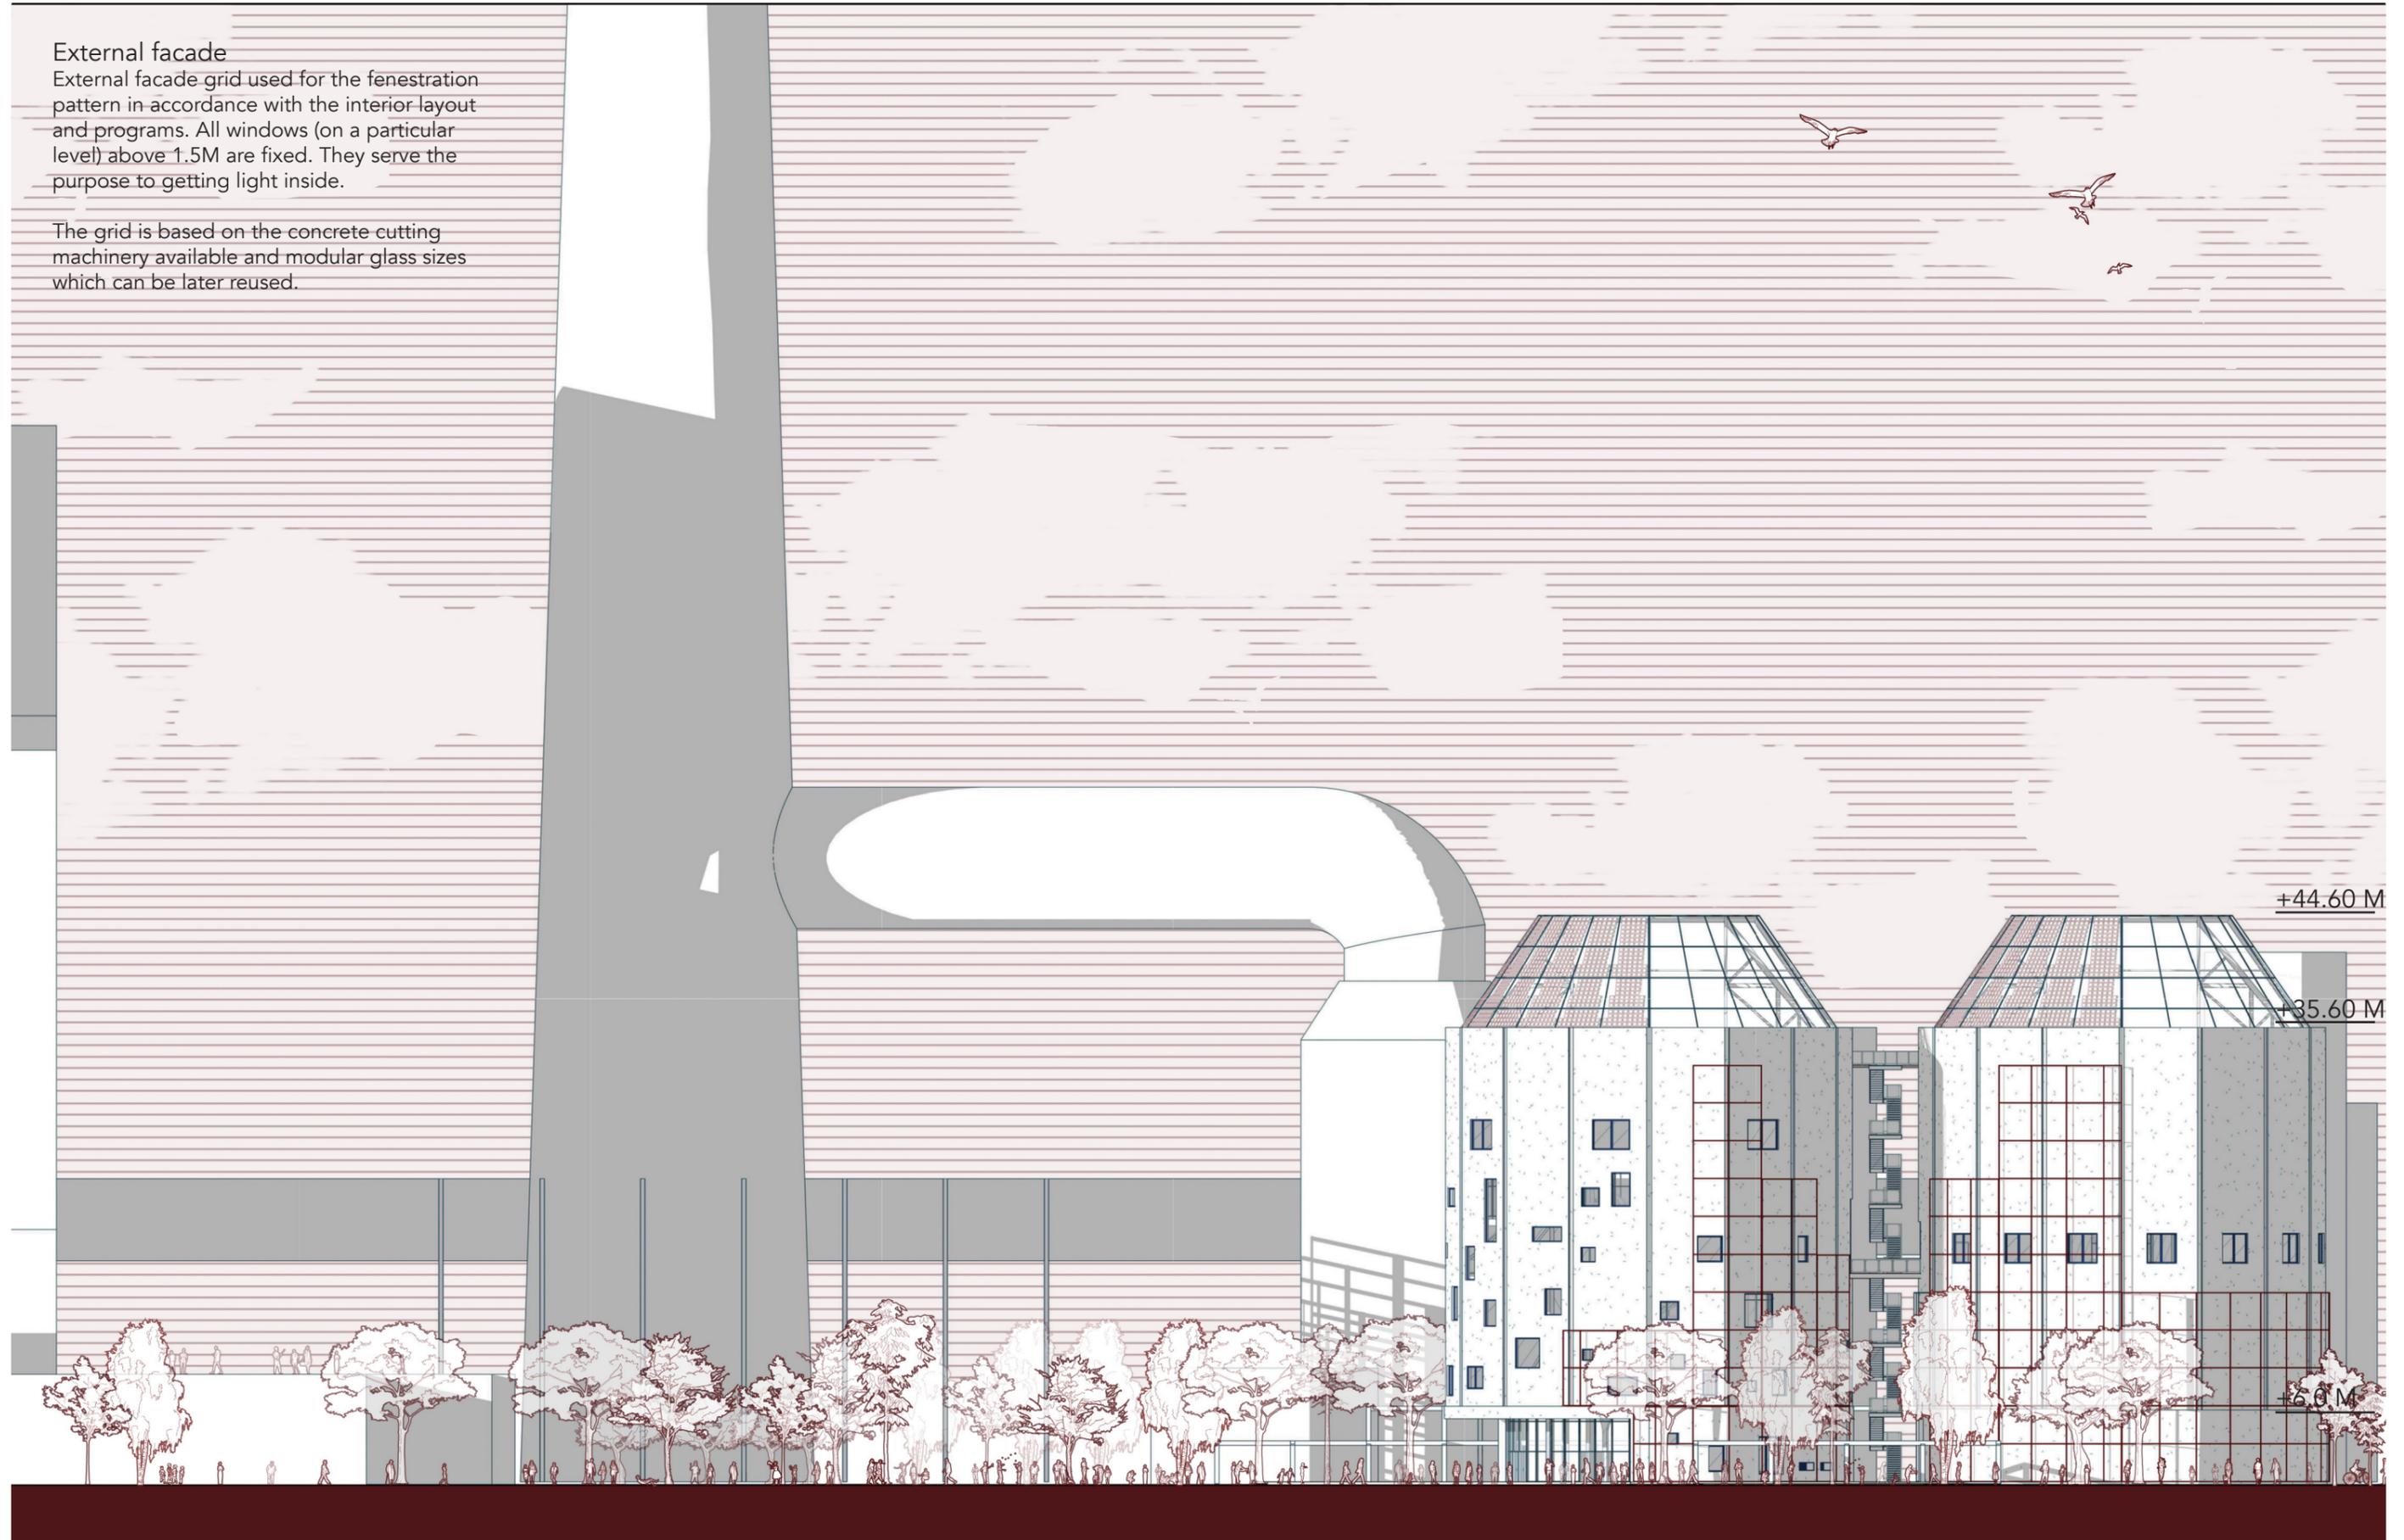

# EAST ELEVATION

## External facade

External facade grid used for the fenestration pattern in accordance with the interior layout and programs. All windows (on a particular level) above 1.5M are fixed. They serve the purpose to getting light inside.

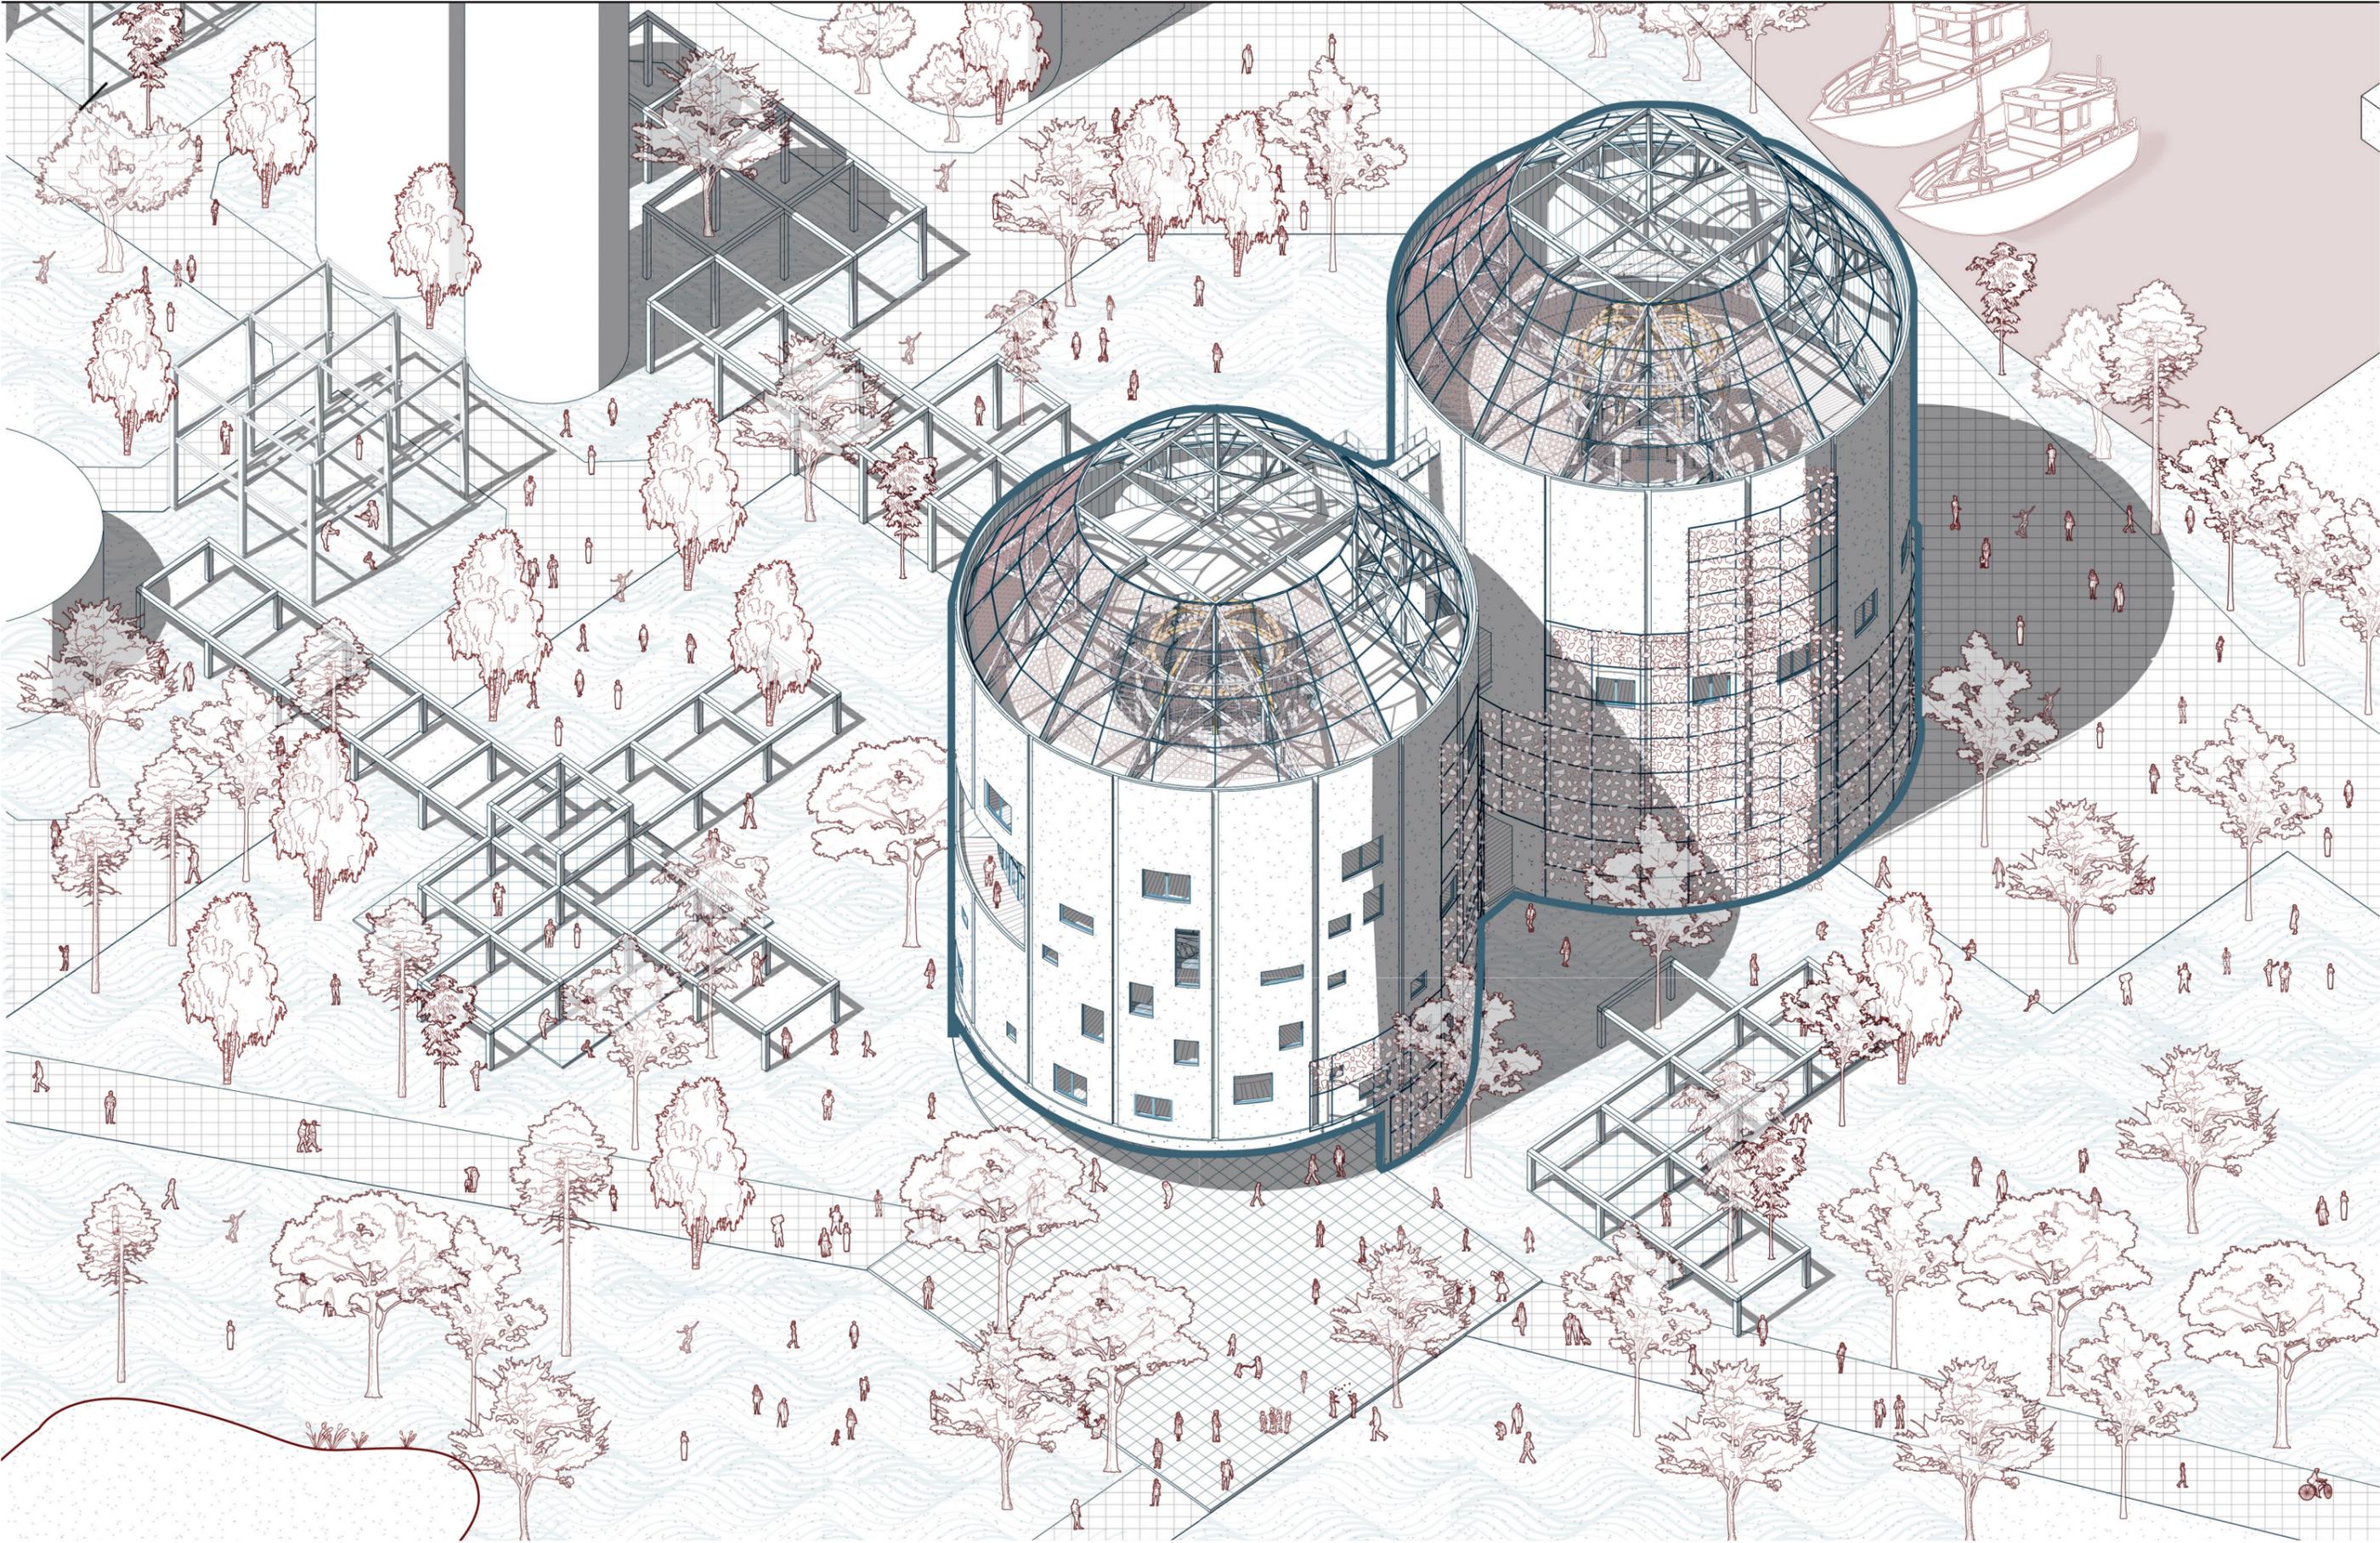

The grid is based on the concrete cutting machinery available and modular glass sizes which can be later reused.

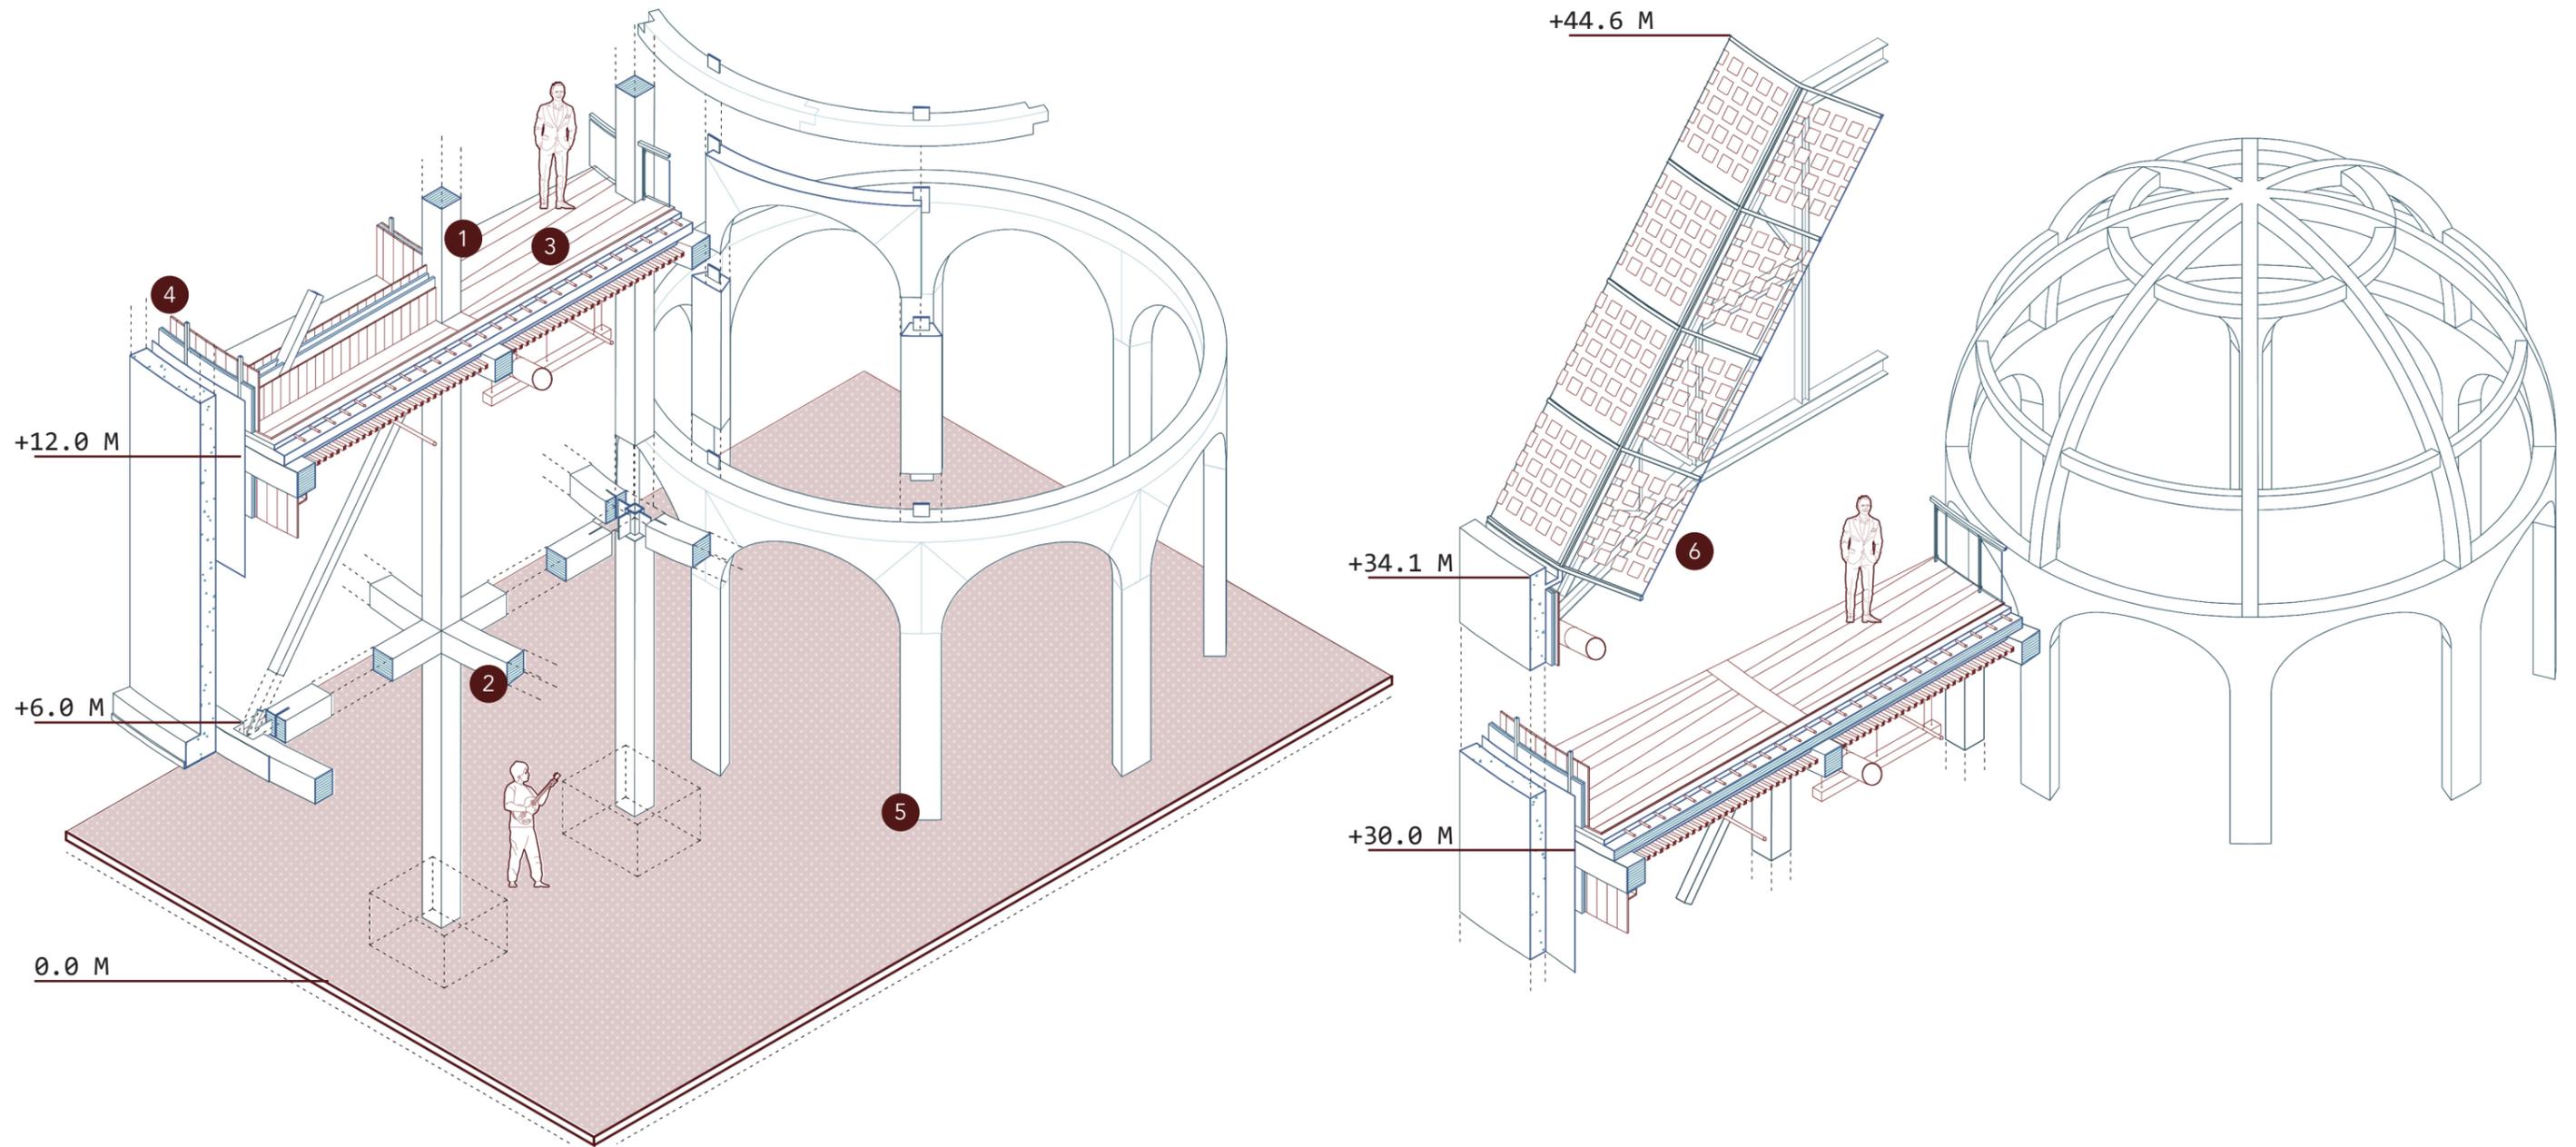

# SOUTH ELEVATION

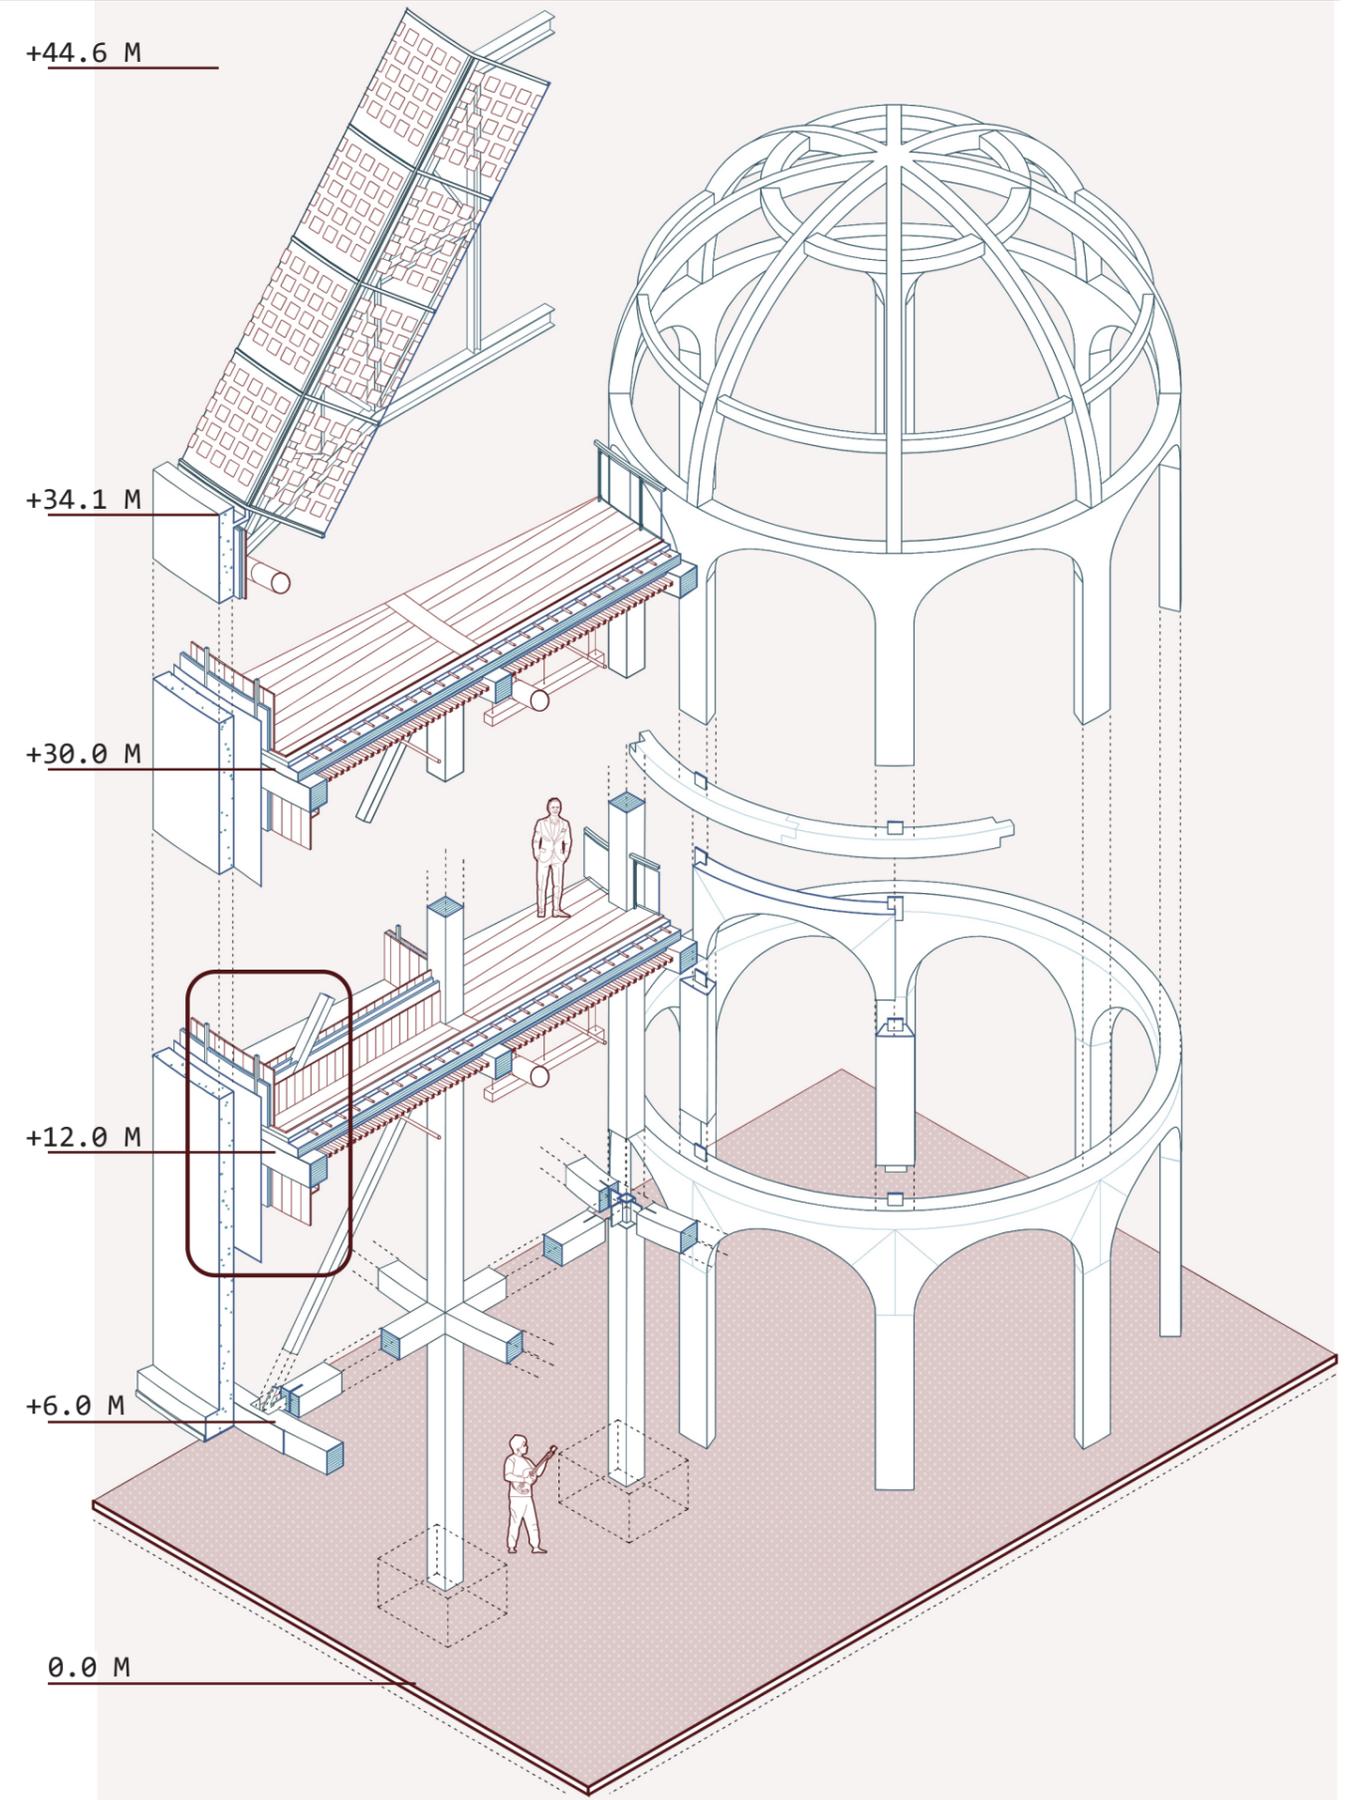

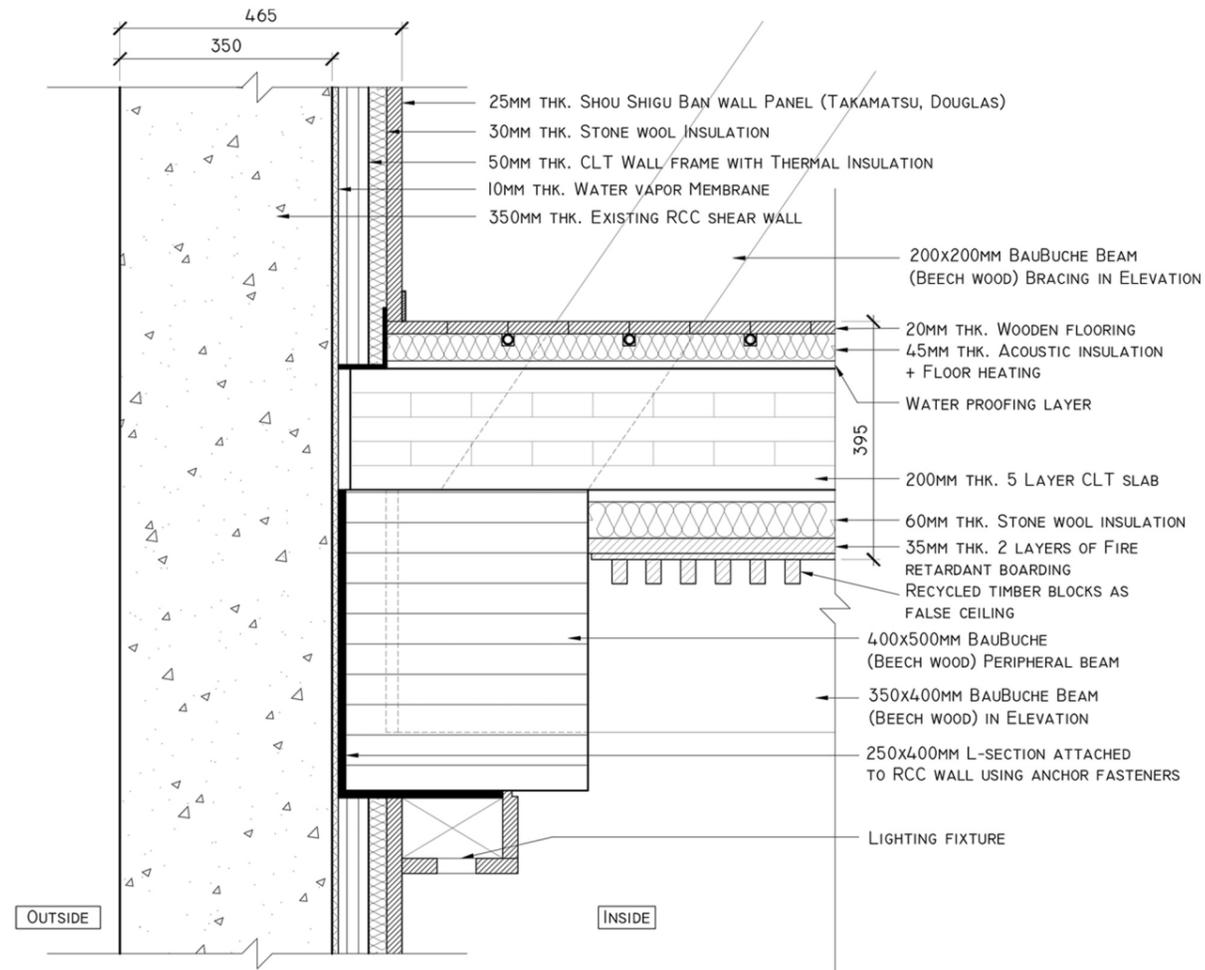

AXONOMETRIC

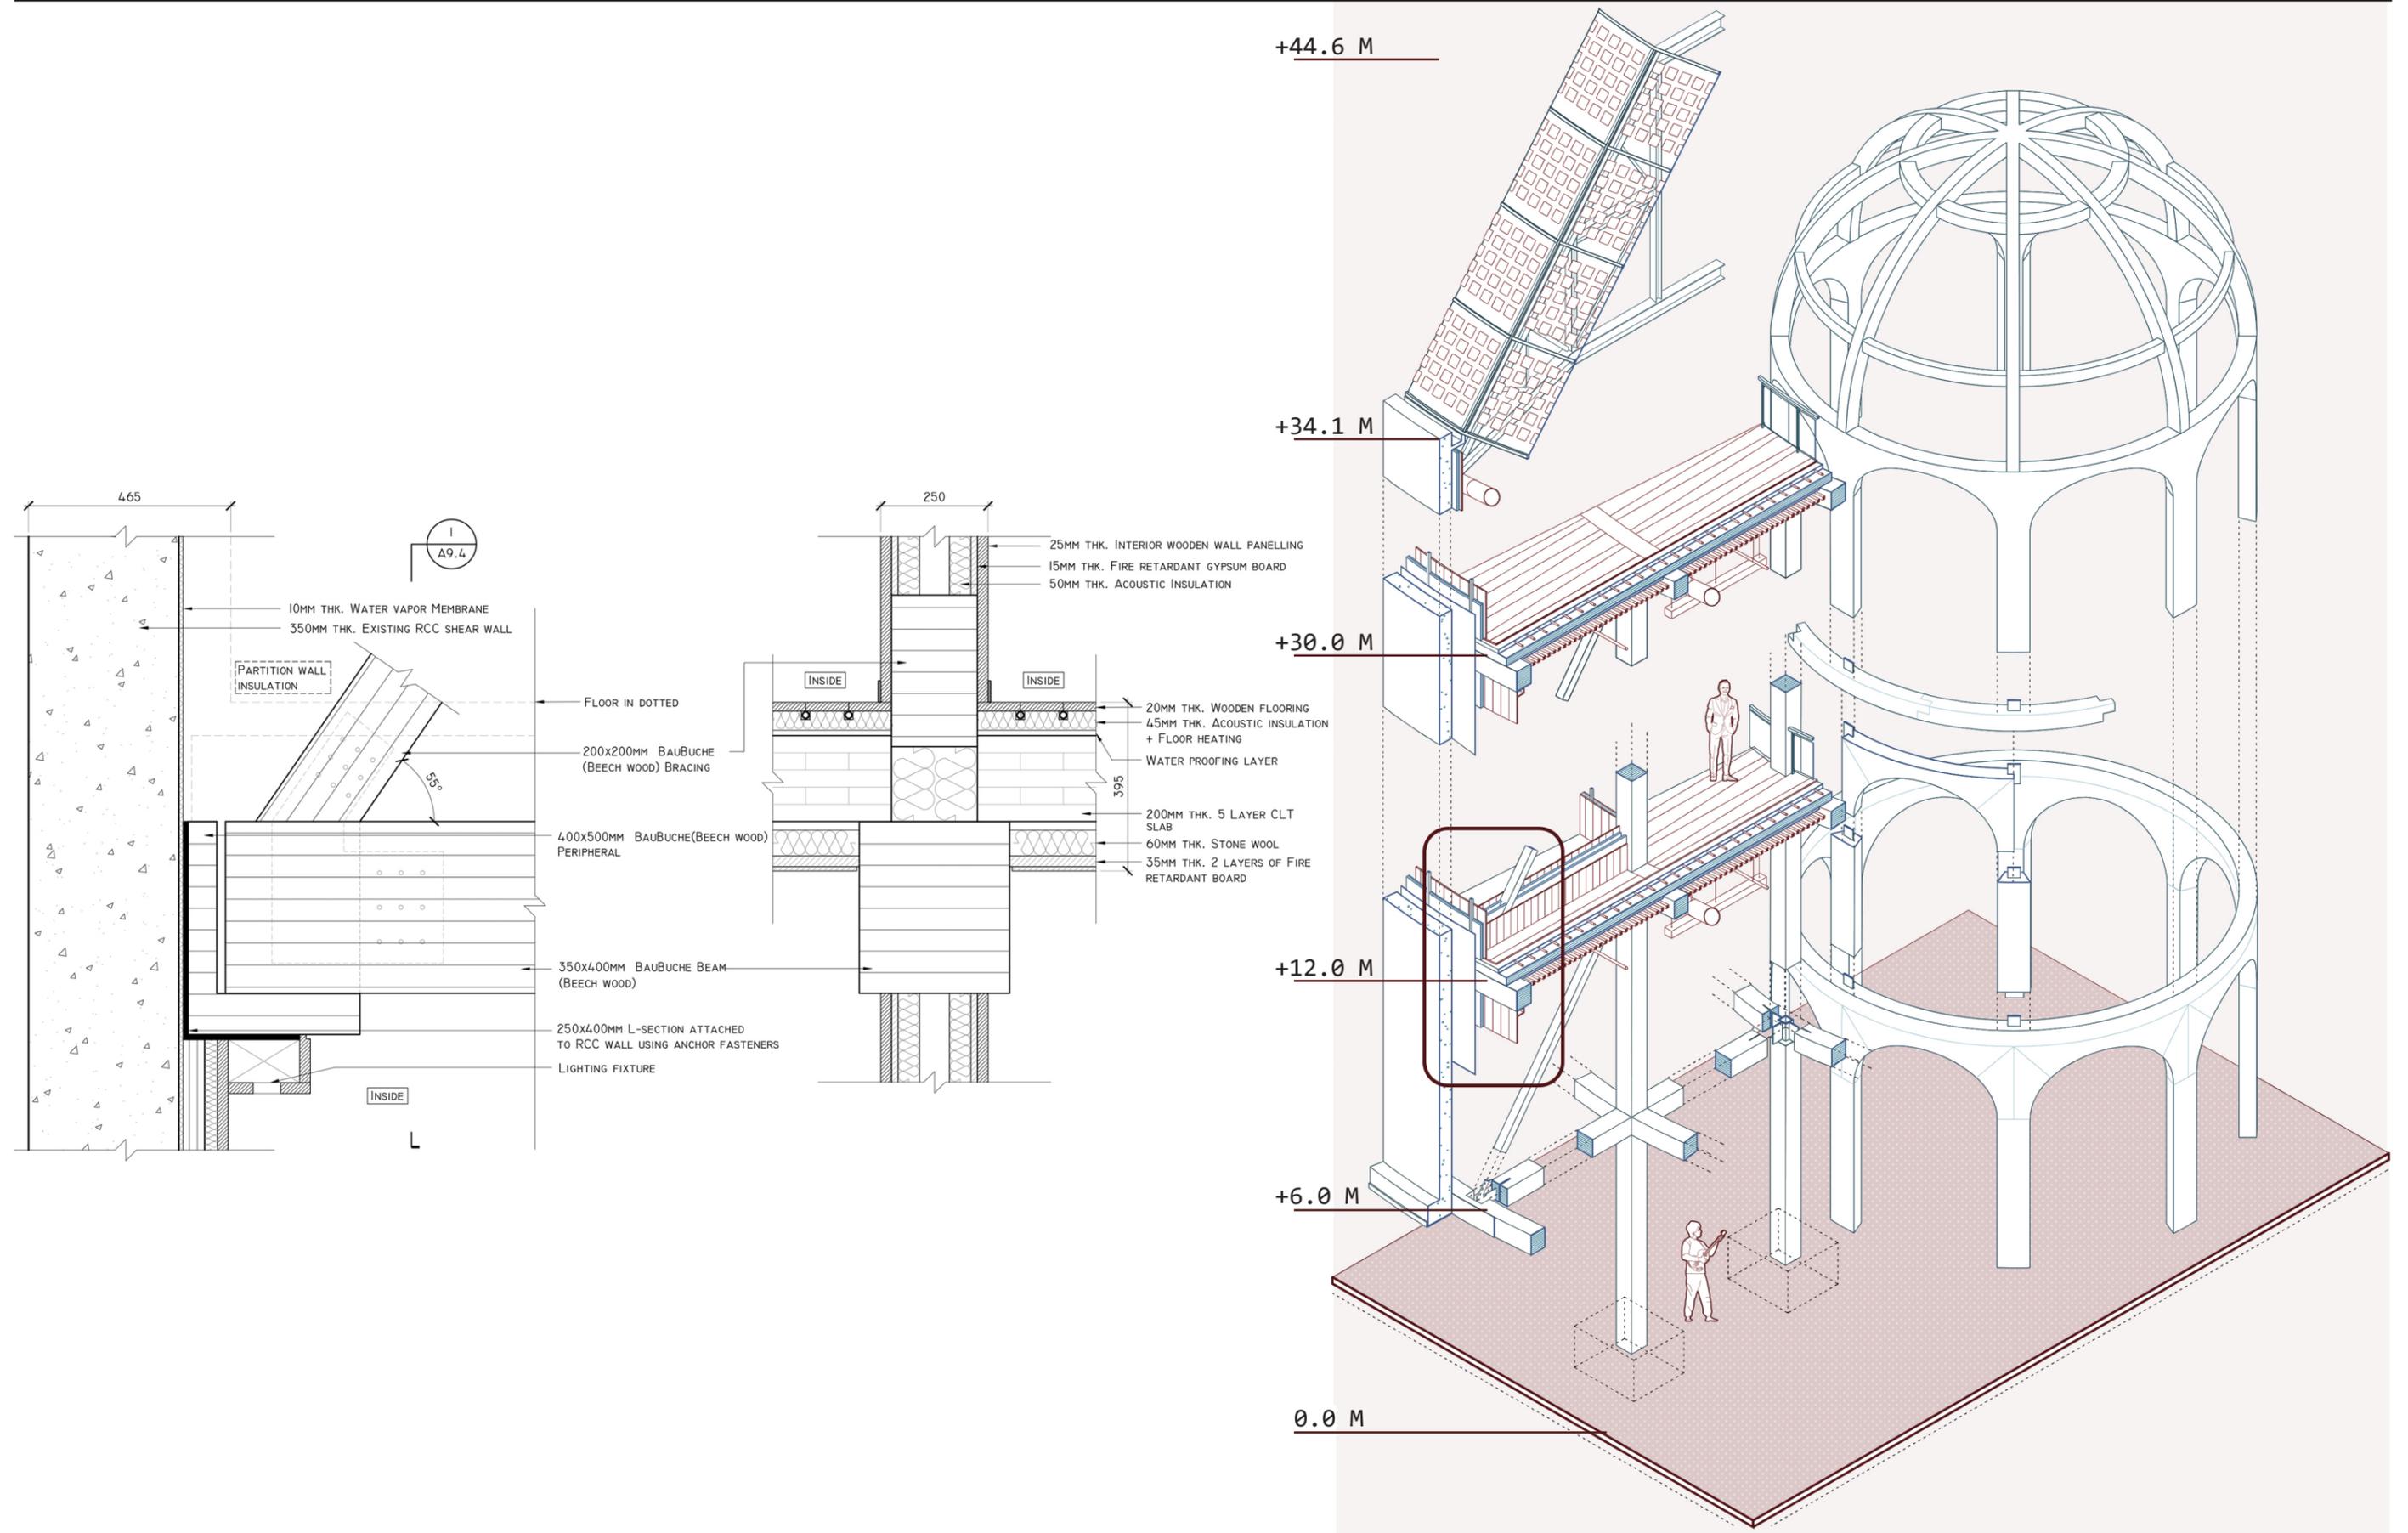

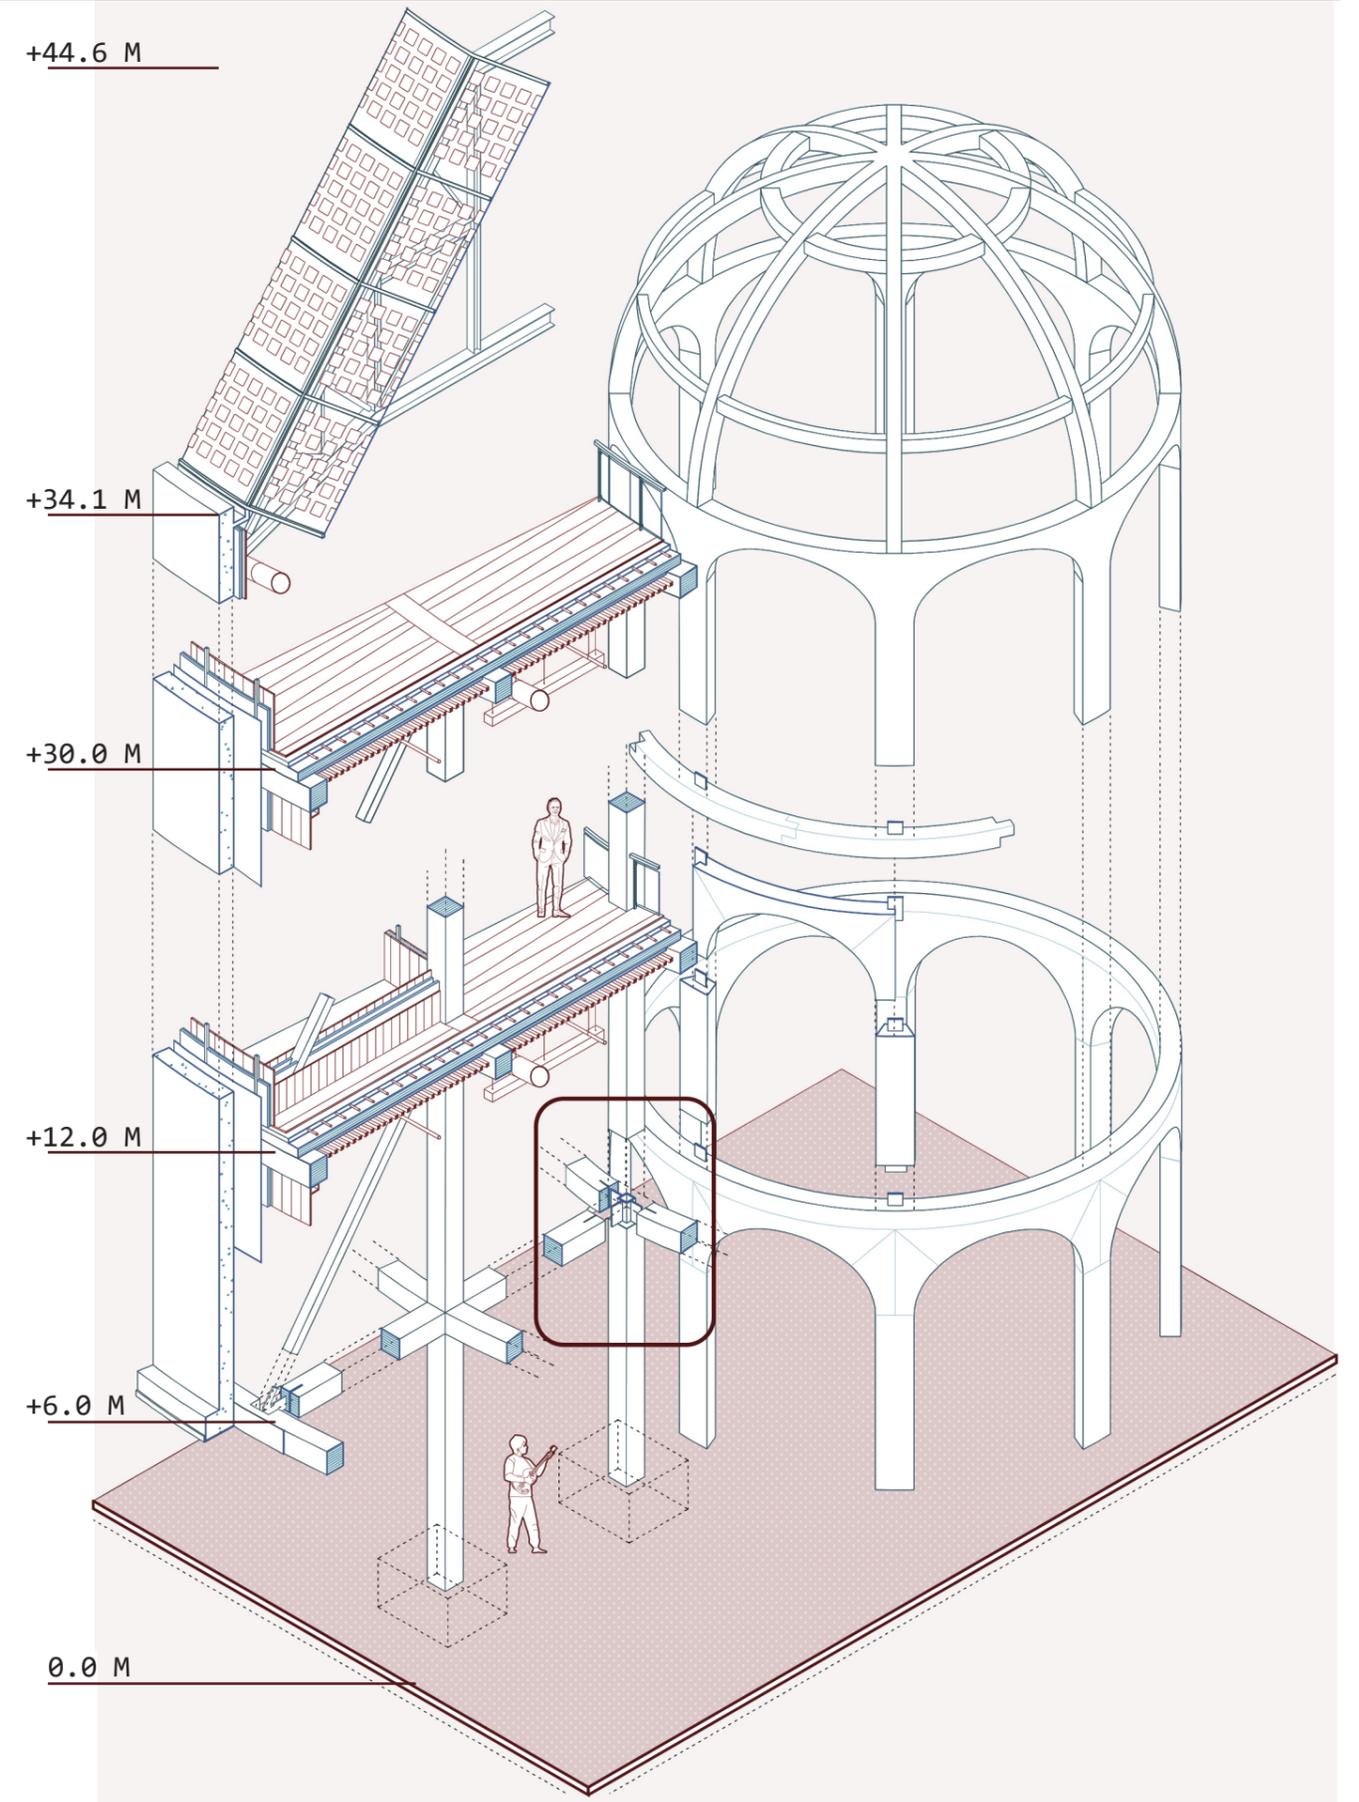

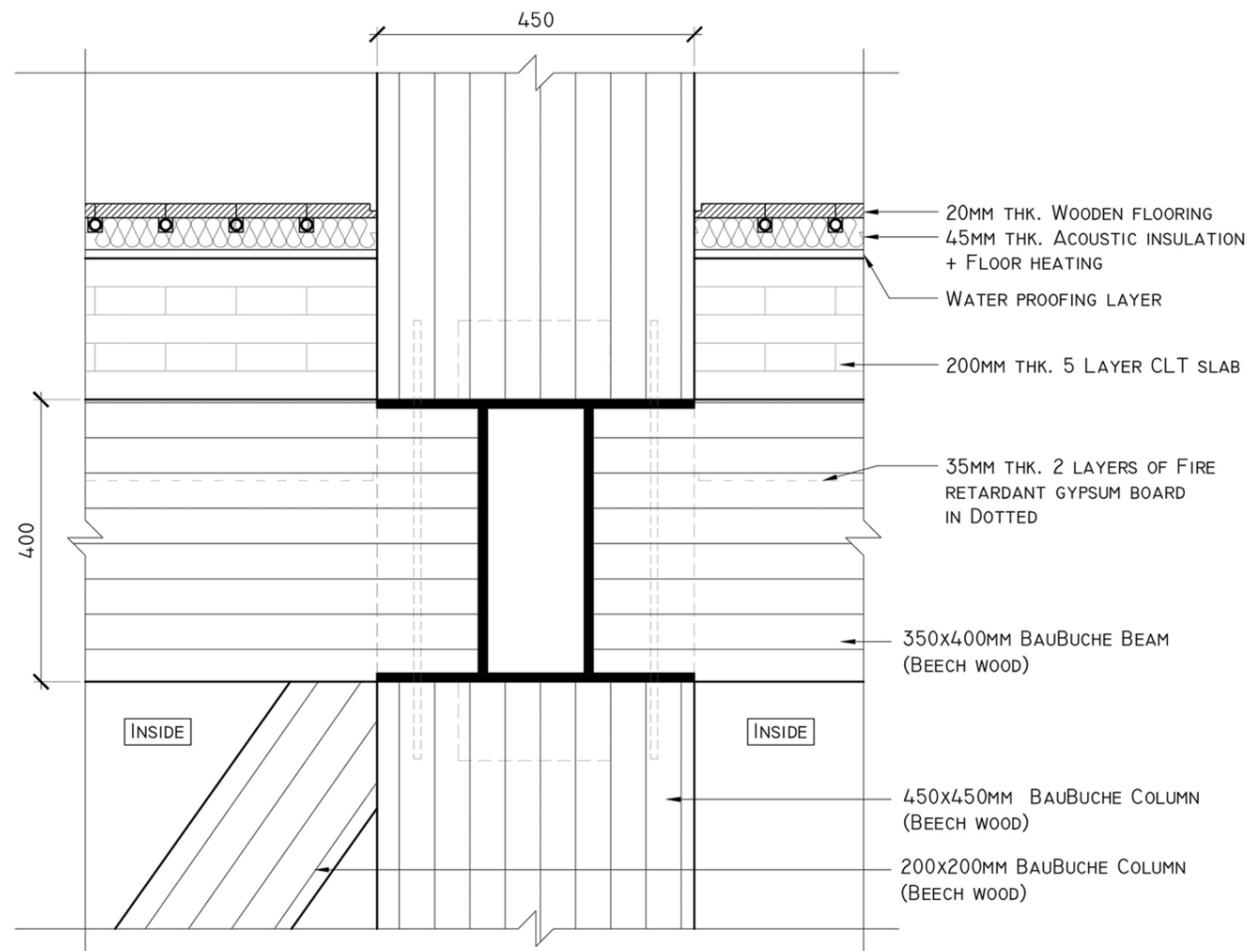

- 1. 400x450mm BauBuche Beech wood column.
- 2. 350x400mm BauBuche Beech wood beam.
- 3. Slab : 20mm thk. Wooden Flooring  
Acoustic insulation + Floor heating  
Water proofing layer  
200mm thk. 5 Layer CLT Slab  
60mm thk. Stone wool insulation  
35mm thk. 2 layers of fire retardant boarding  
Recycled Timber blocks as False ceiling  
Service Level

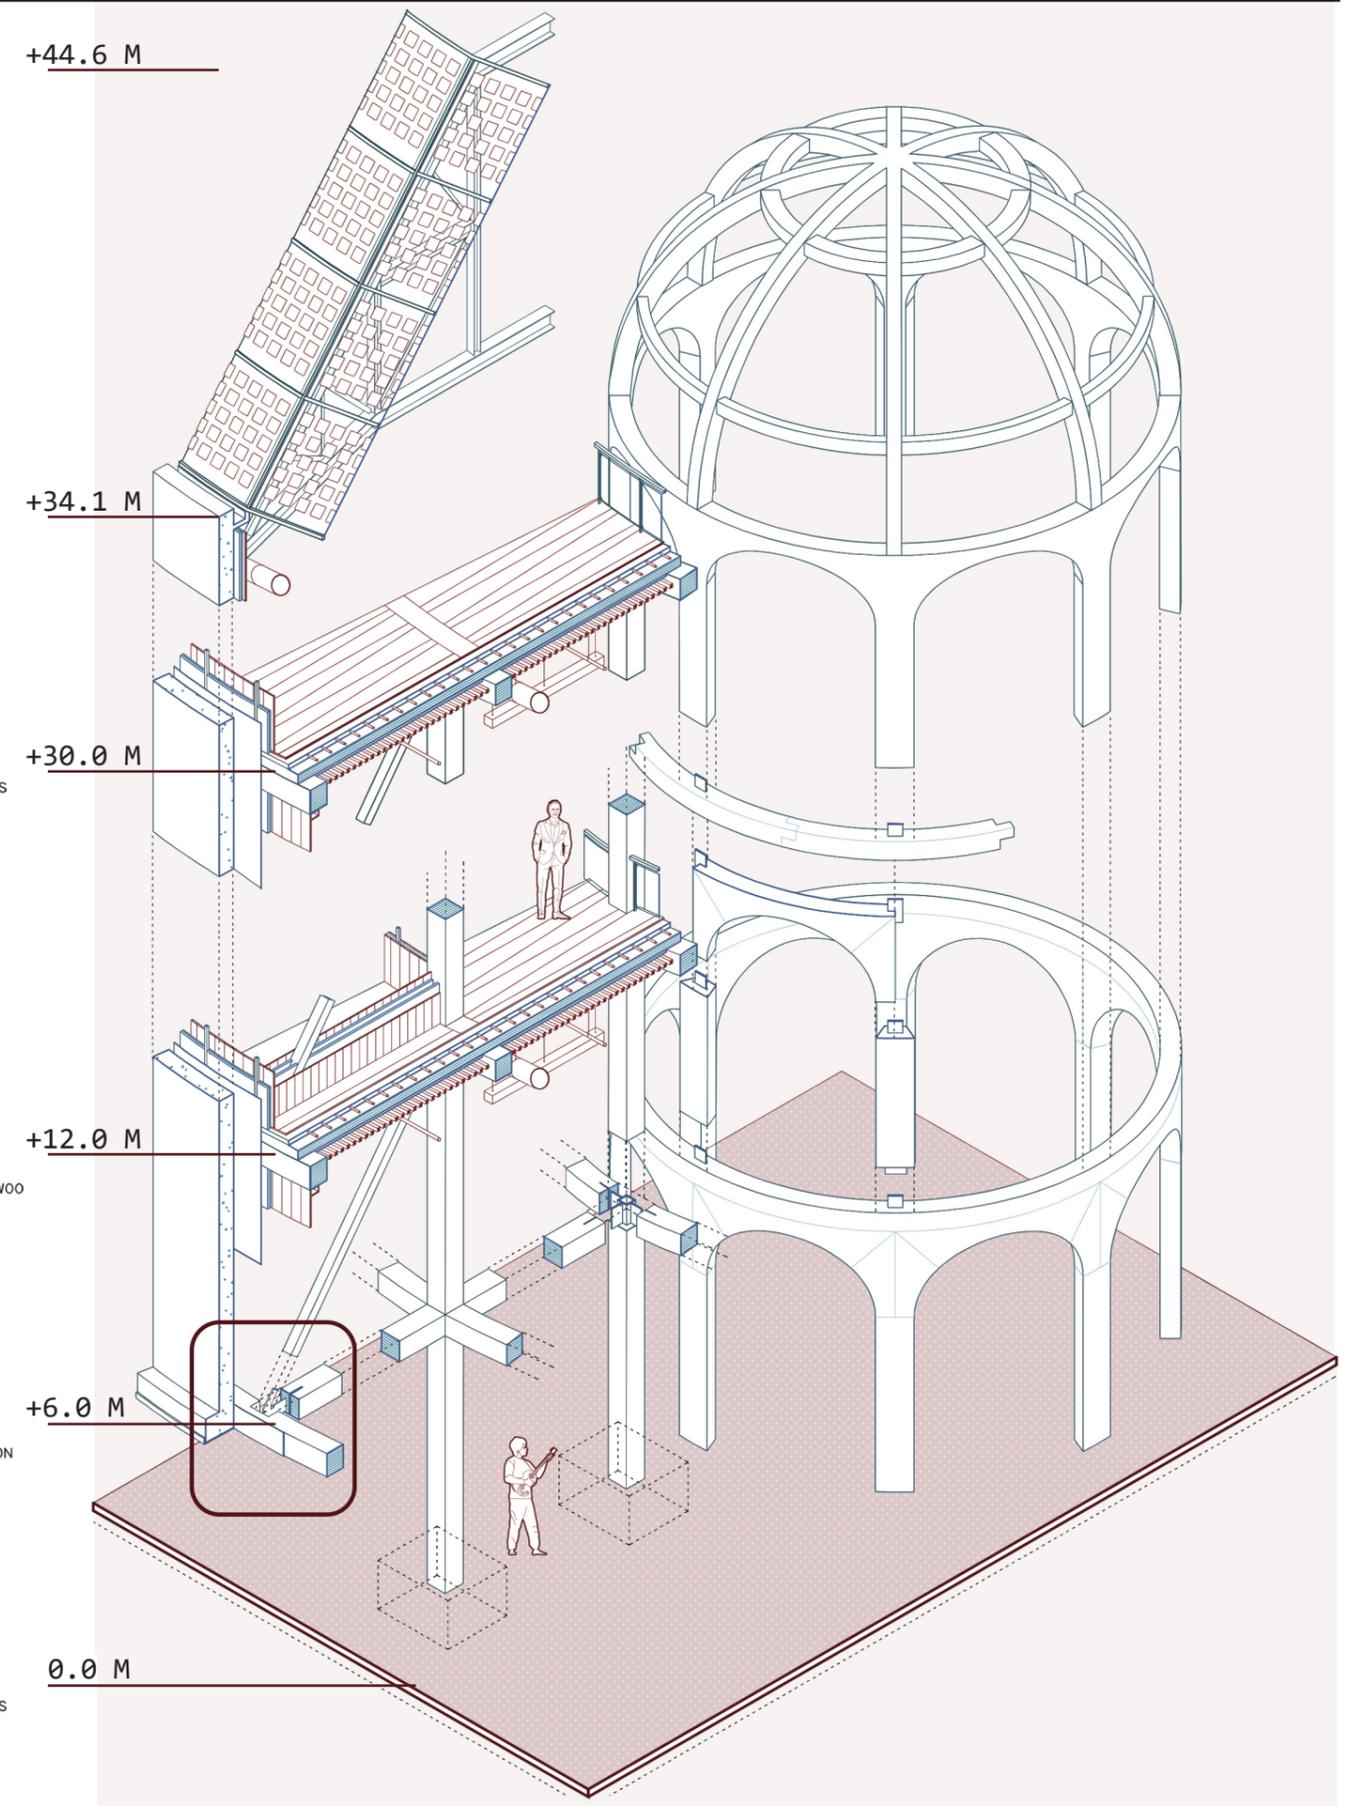

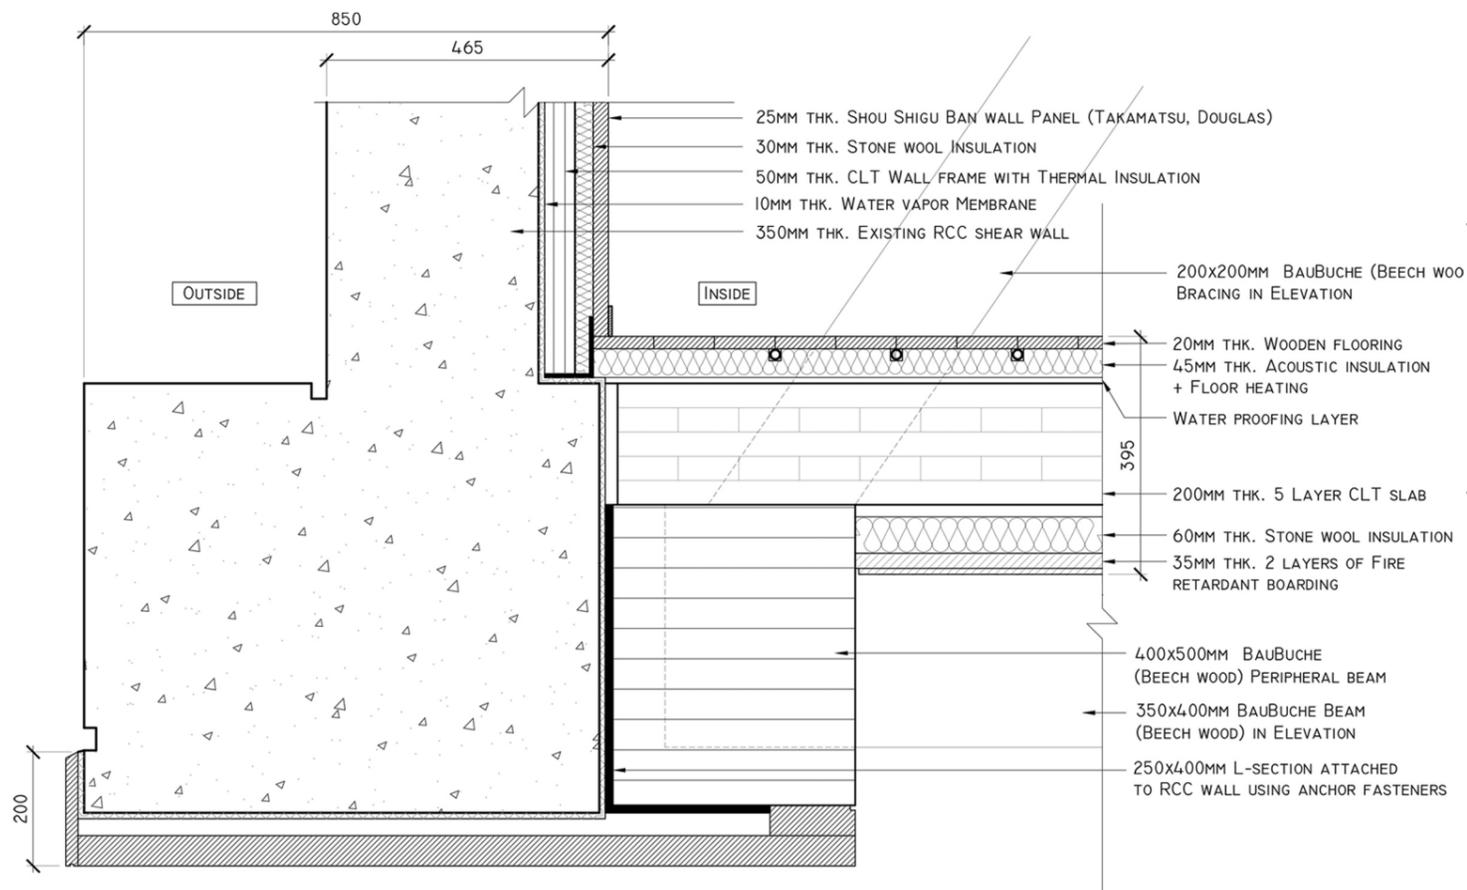

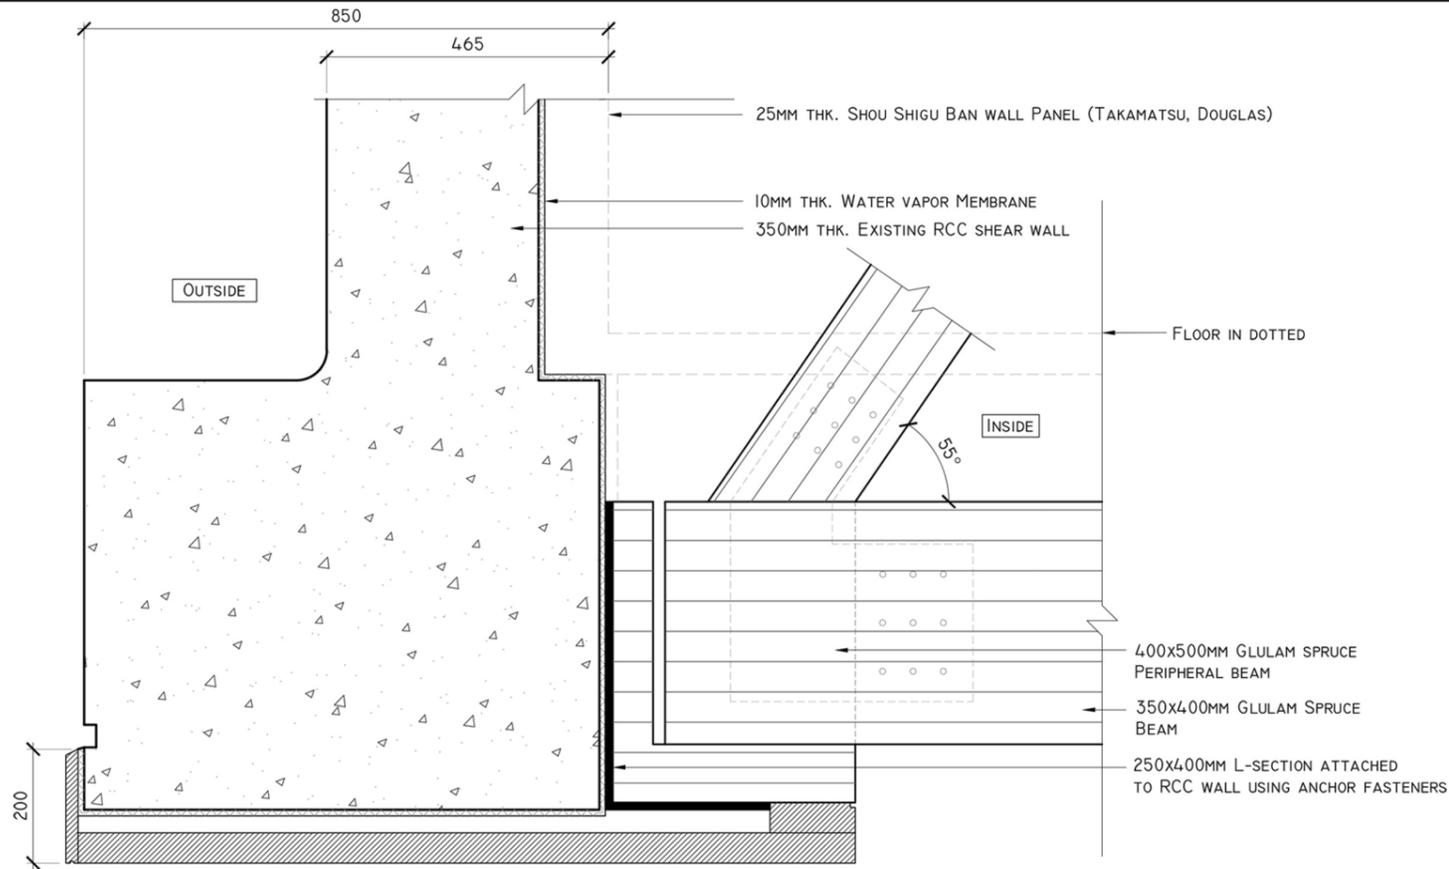

- 4. External Wall: 25mm thk. Shou Shigu Ban panel. (interior)  
30mm thk. Stone wool insulation  
50mm thk. Thermal wool insulation + CLT wall frame  
Water Vapor Membrane  
350mm thk. Existing RCC Shear Wall.(External)
- 5. Arch-Atrium
- 6. Roof: Semi-transparent solar panels  
Automated curtain system with beige fabric to prevent sunlight  
During summers.

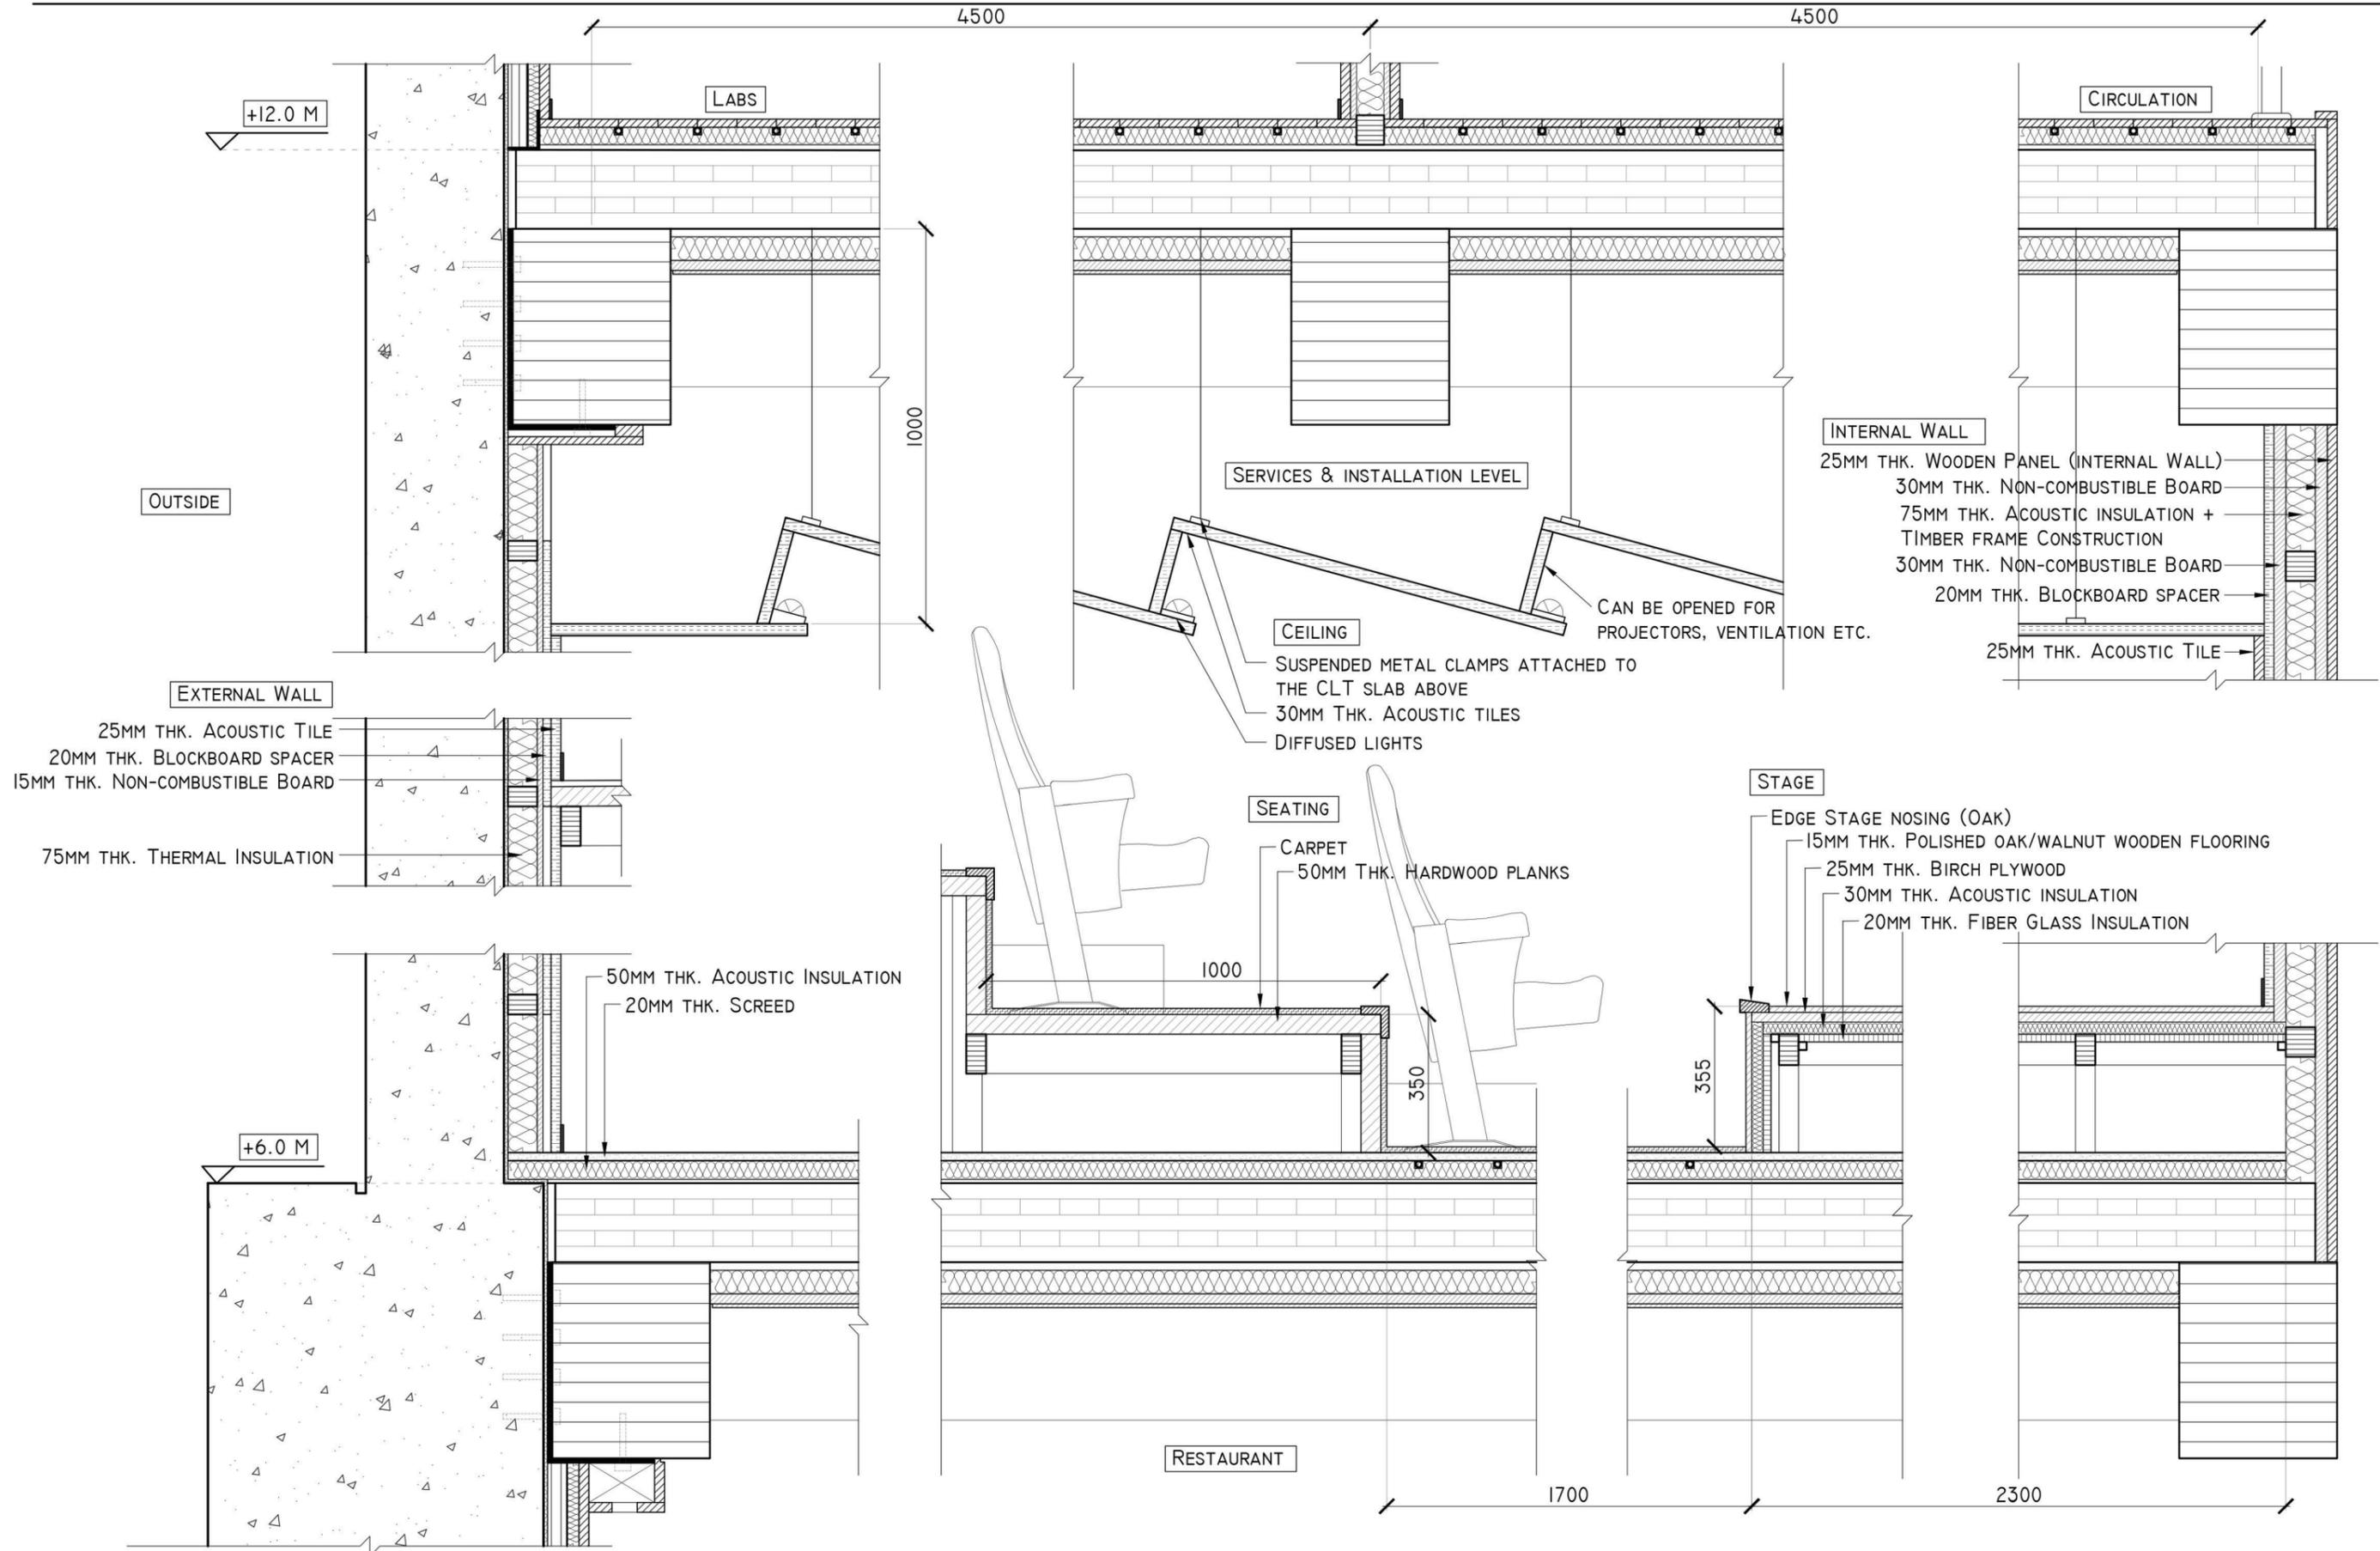

# STRUCTURE & DETAILS

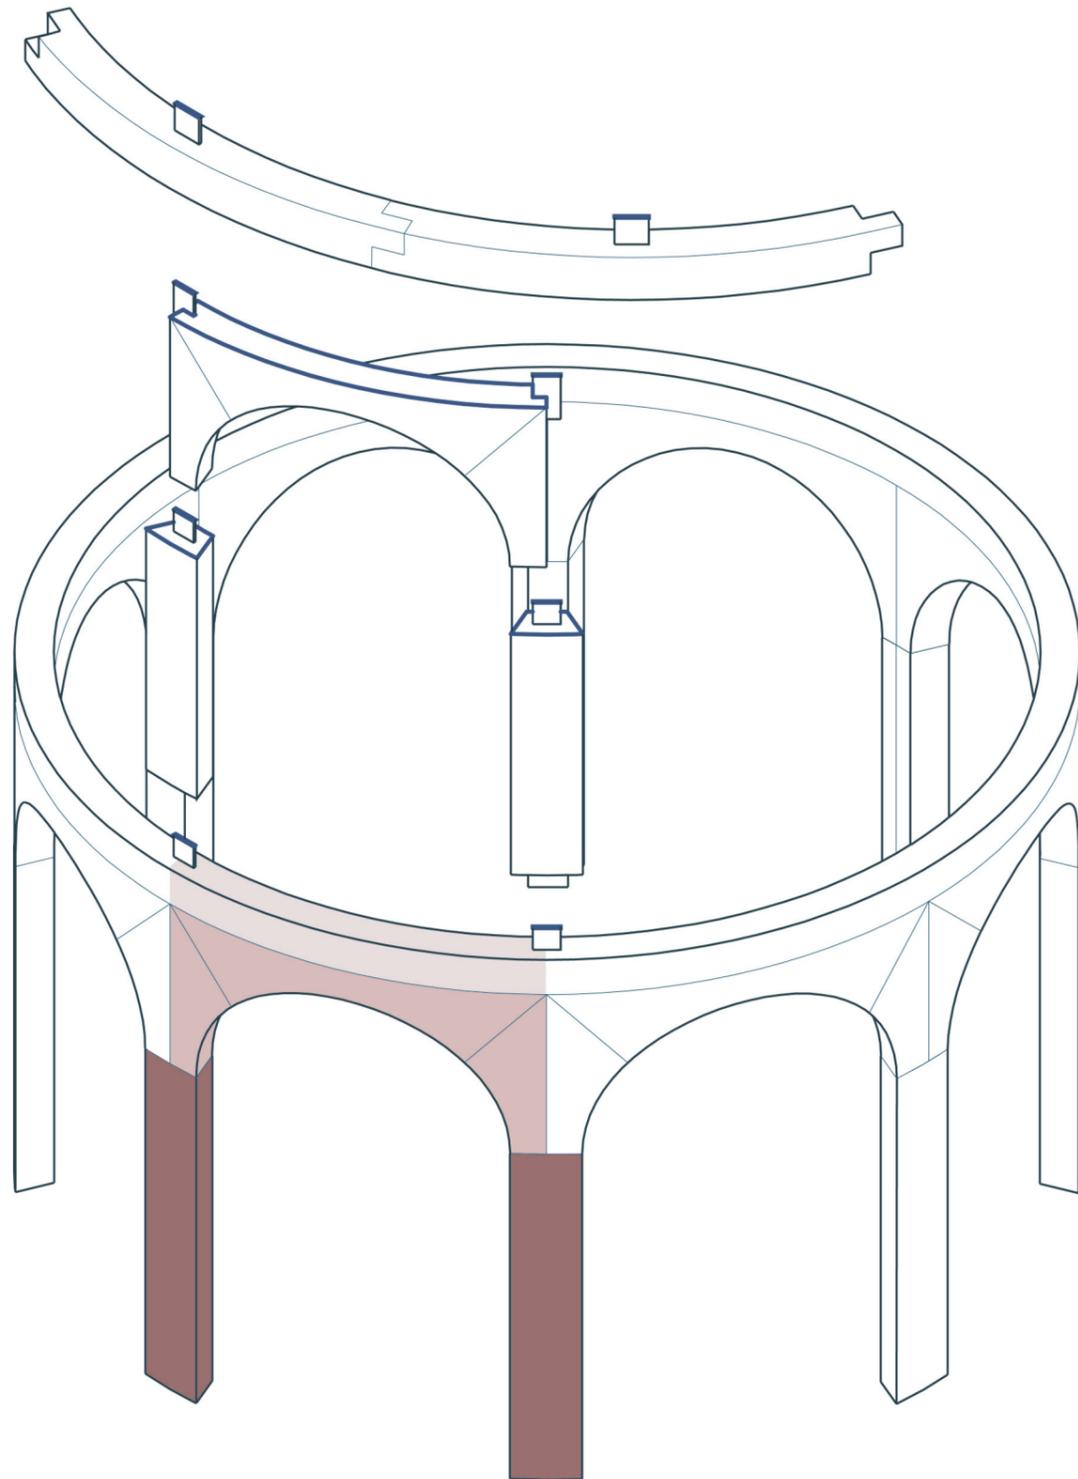

# AUDITORIUM DETAILS

# ARCH-ATRIUM

Central Arch-Atrium assembled using two separate method of production.

1. Digitally Cutting the profiles.
2. Removing Moisture from the wood and bending the wood. (using self-bending timber method)
3. Mechanically Bending the members

Self-bending timber developed by researchers from ETH Zurich, Empa And Uni. Of Stuttgart.

[Image on the right is a 14meter Urbach Tower designed using this wood. It consists of twelve Spruce panels, composed of multiple bilayer panels with a length of 5meters each.] <https://ethz.ch/en/news-and-events/eth-news/news/2019/09/self-shaping-wood.html>

**An Arch is built in 3 segments of spruce panels** which are then connected together to create the arcade.

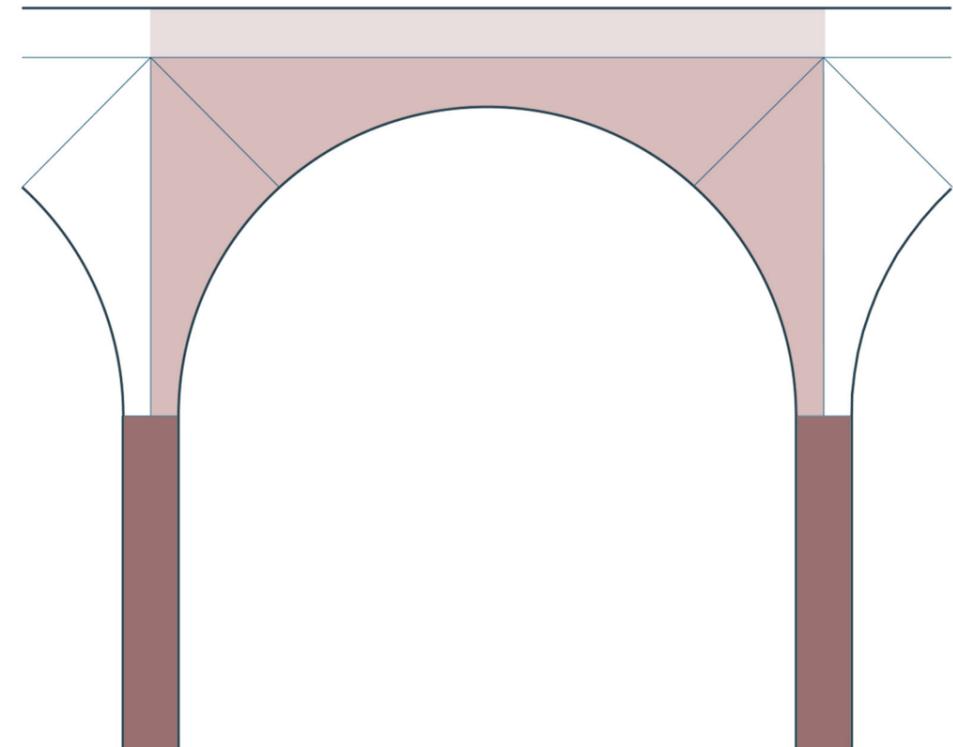

**Top** - Tie beam (bent in 1 direction, ie 'X' Axis)

**Middle** - Arch Beam (bent in 1 directions, ie 'X' and digitally cut in 'Z' Axis)

**Bottom** - 400x400mm BauBuche Beech wood.

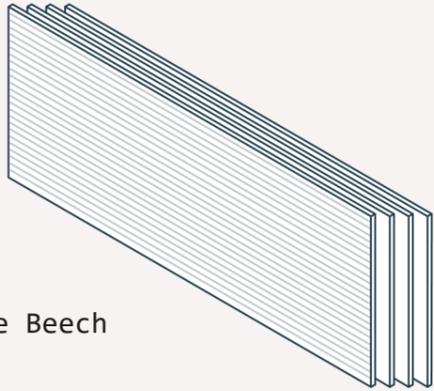

**Process:**

Members are digitally cut to sizes > Slight bent by using the method for 'Self bending timber' > Mechanically bent to shape > Assembled and stacked.

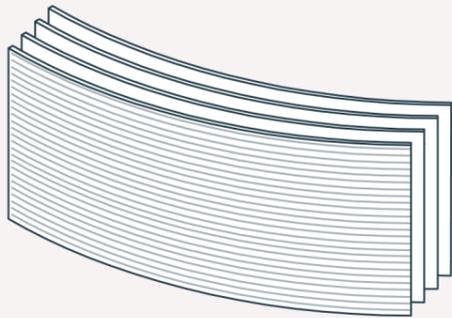

## Bending

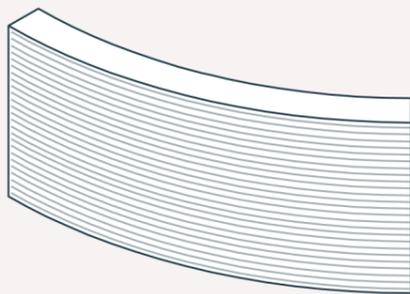

**A**  
BauBuche Beech  
wood

**B**  
Selfing bending by removing moisture +  
Mechanical force.

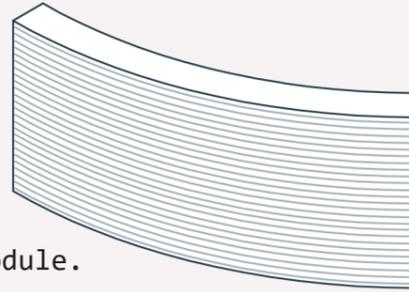

**C**  
Bent pieces stuck together.

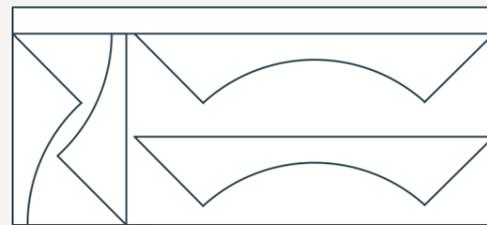

## Digital cutting

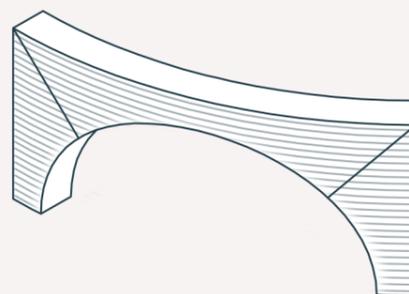

**A**  
Bent module.

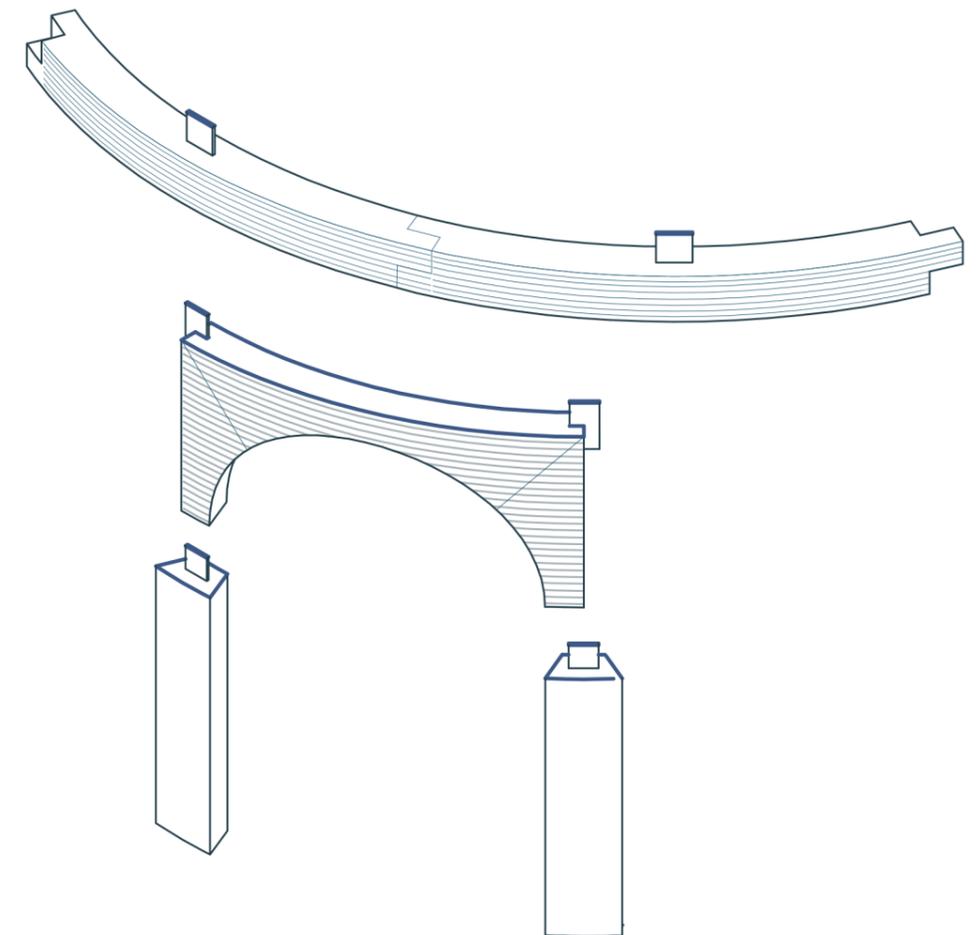

**B**  
Digitally cutting individual members to  
minimise waste.

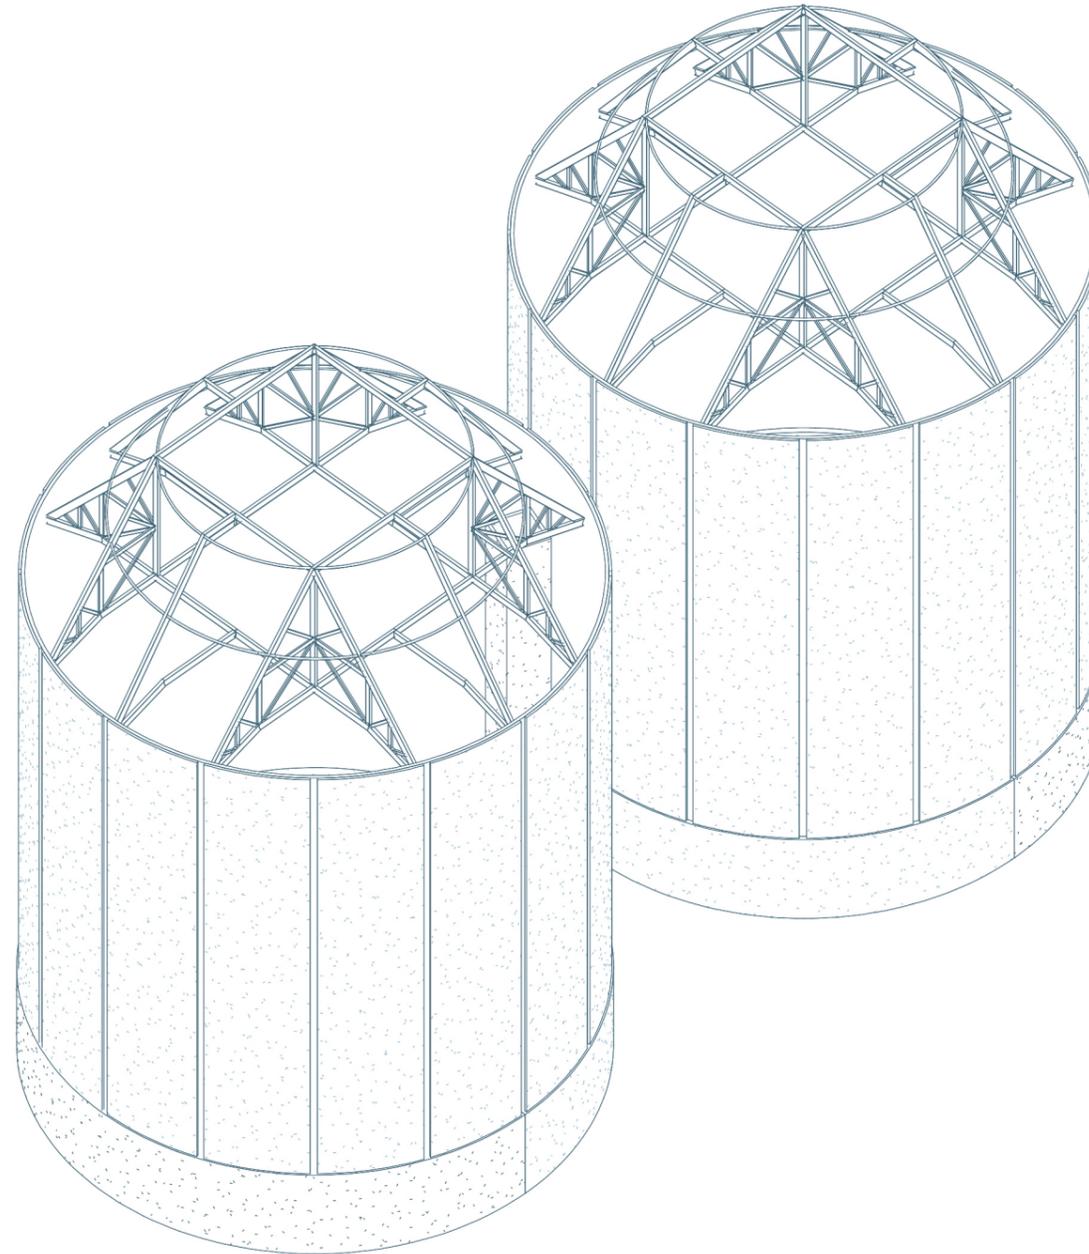

**C**  
Cut members assembled together.

## Assembly

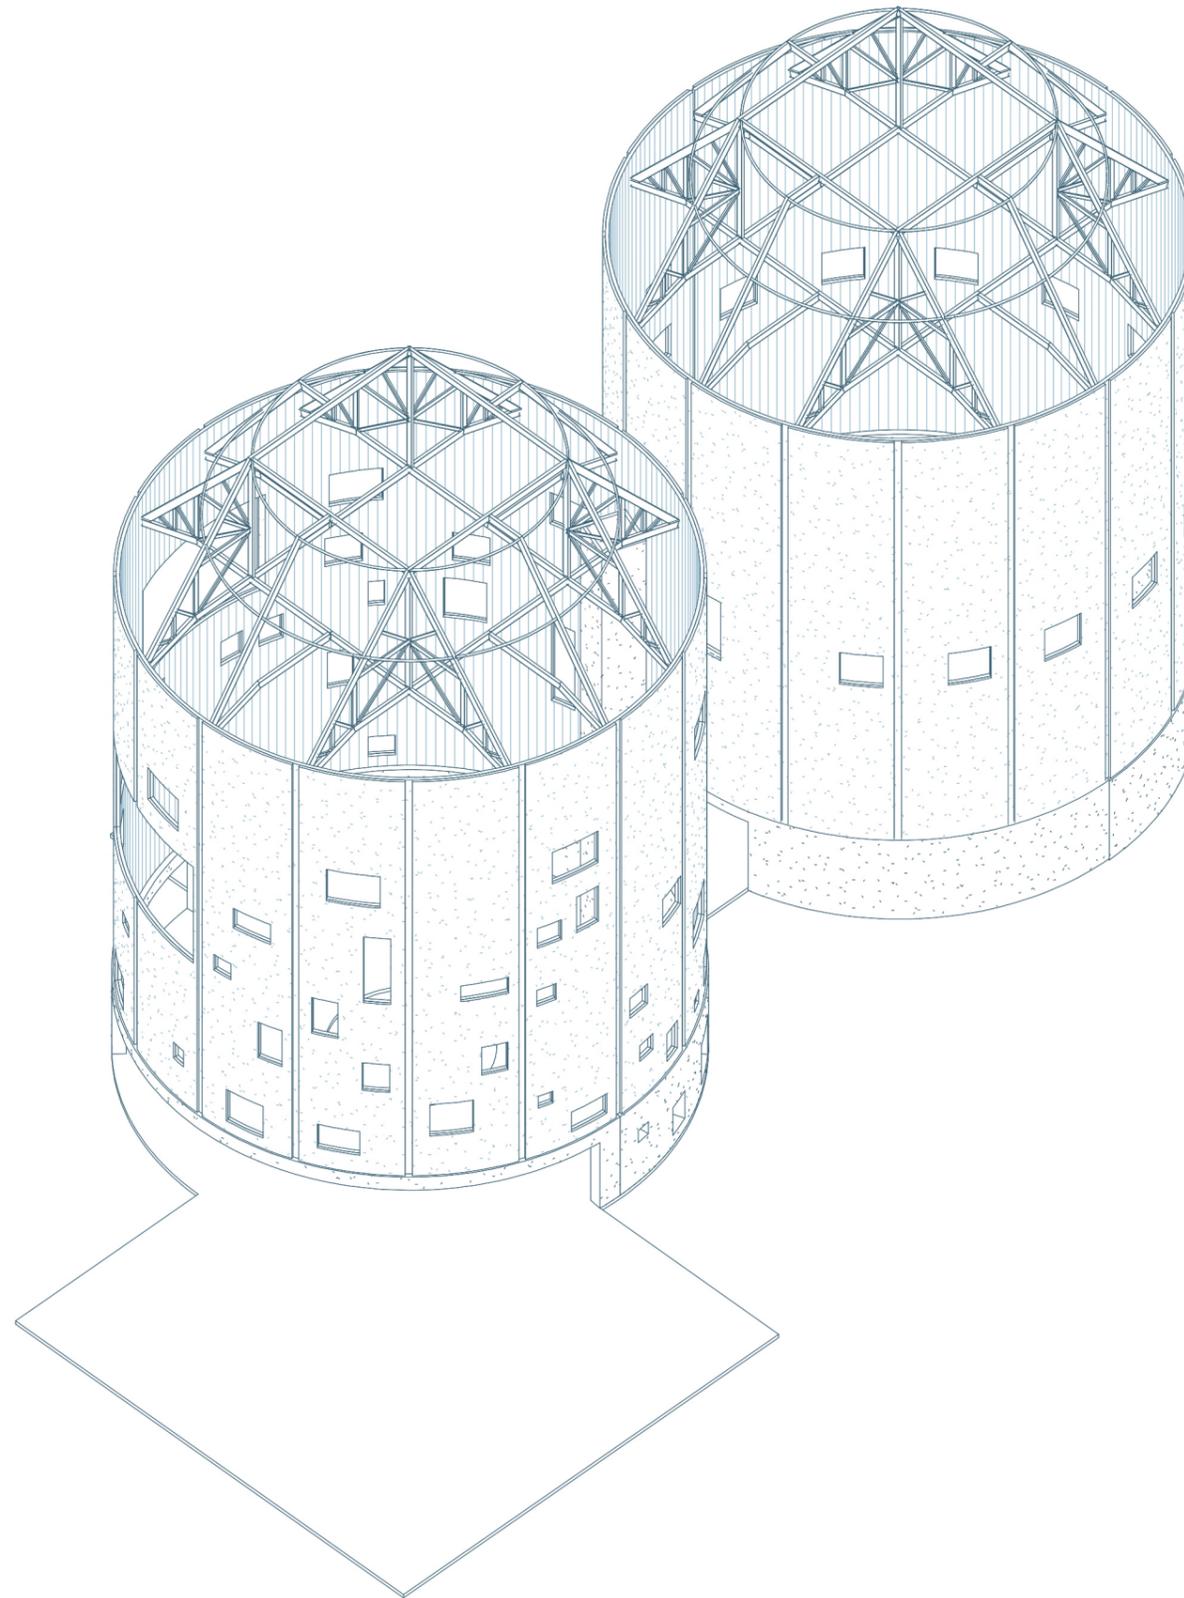

**Step 1:**  
Cleanup of the silos.  
Removing hazardous materials and  
machinery if any.  
Removal of PV roof.

**Step 2:**

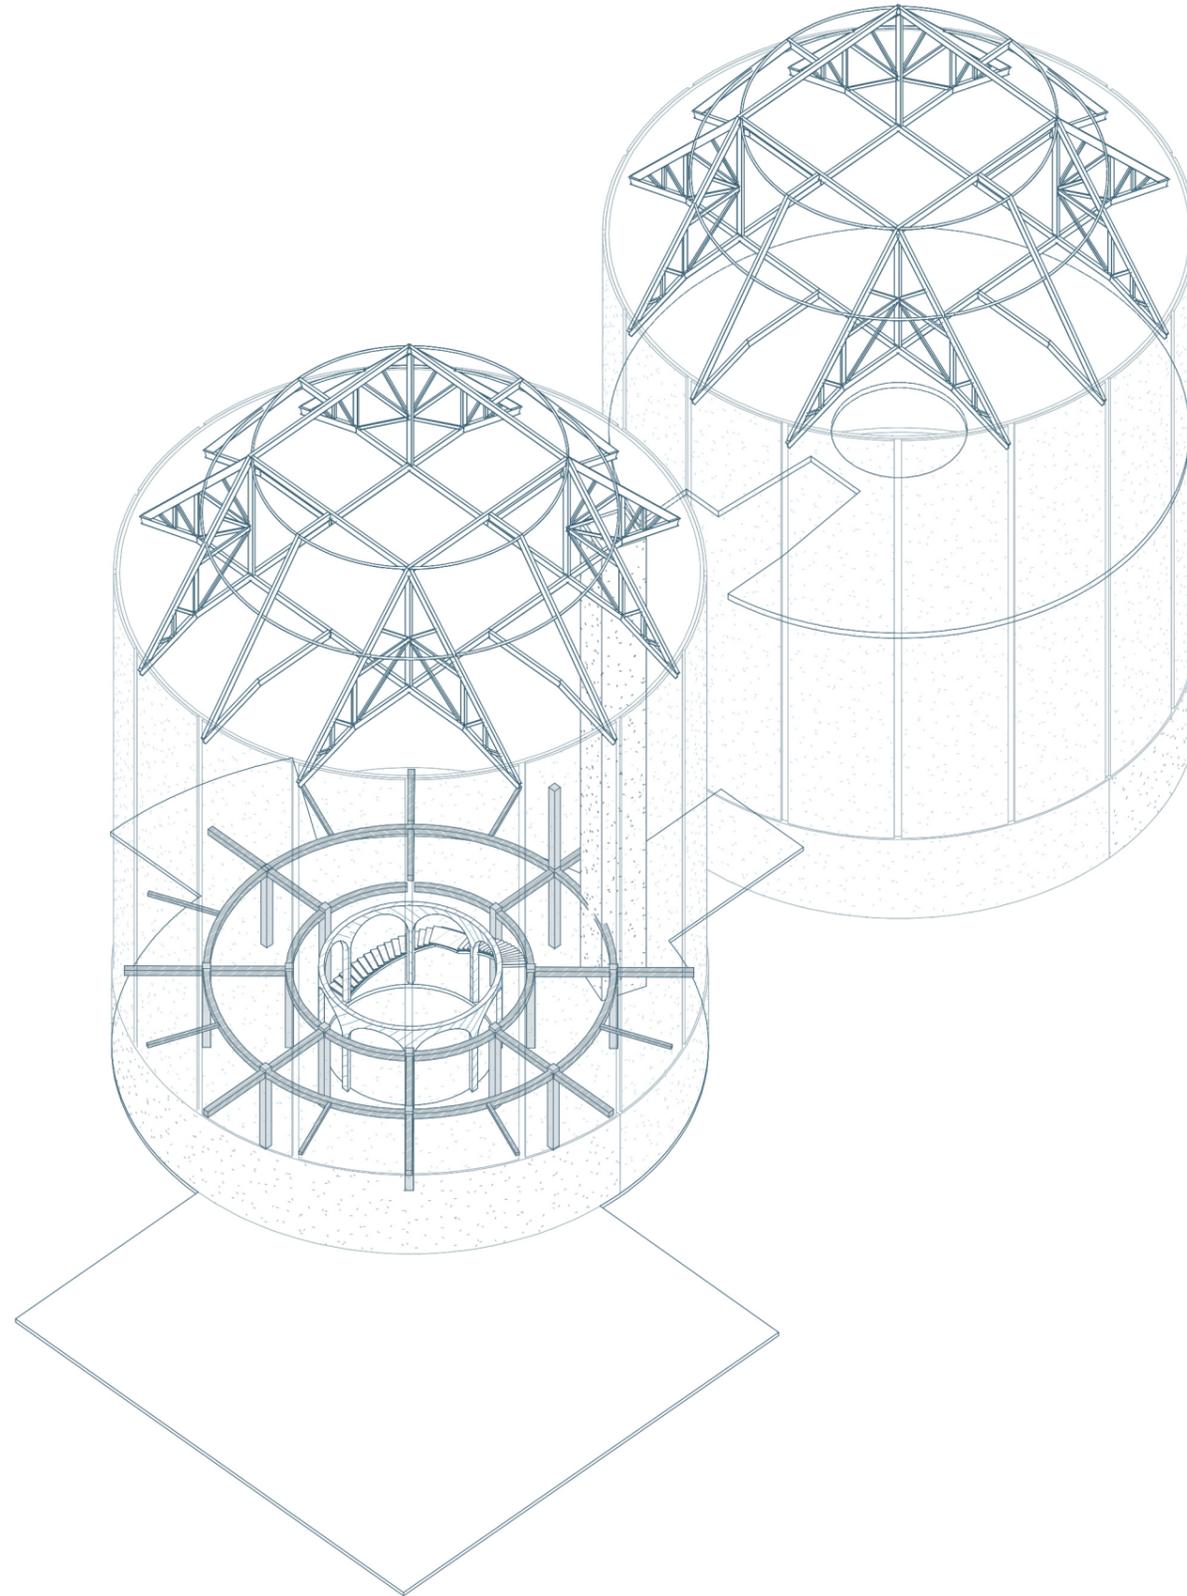

Partial openings from the bottom.  
Initiation of construction of basalt battery.  
Construction of Concrete service and lift core.

\*the construction of the basalt battery starts when the openings have been made. The concrete removed is reused for the construction of the battery.

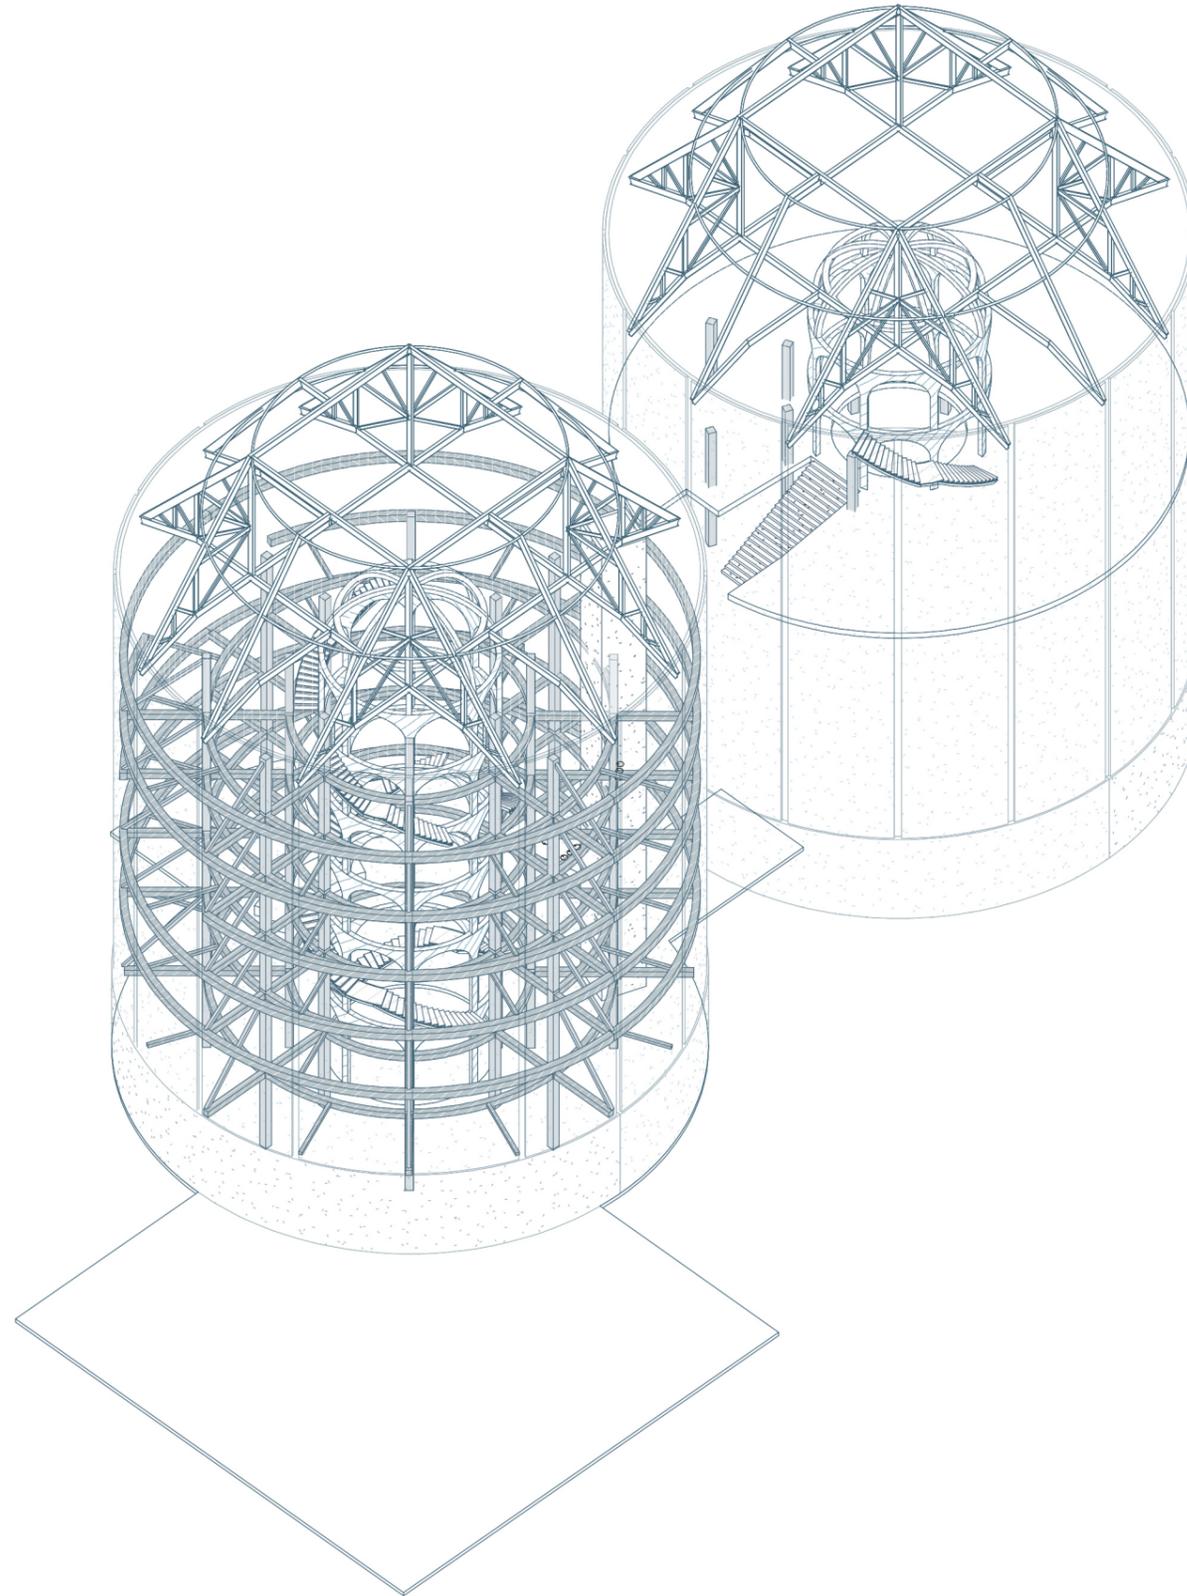

**Step 3:**

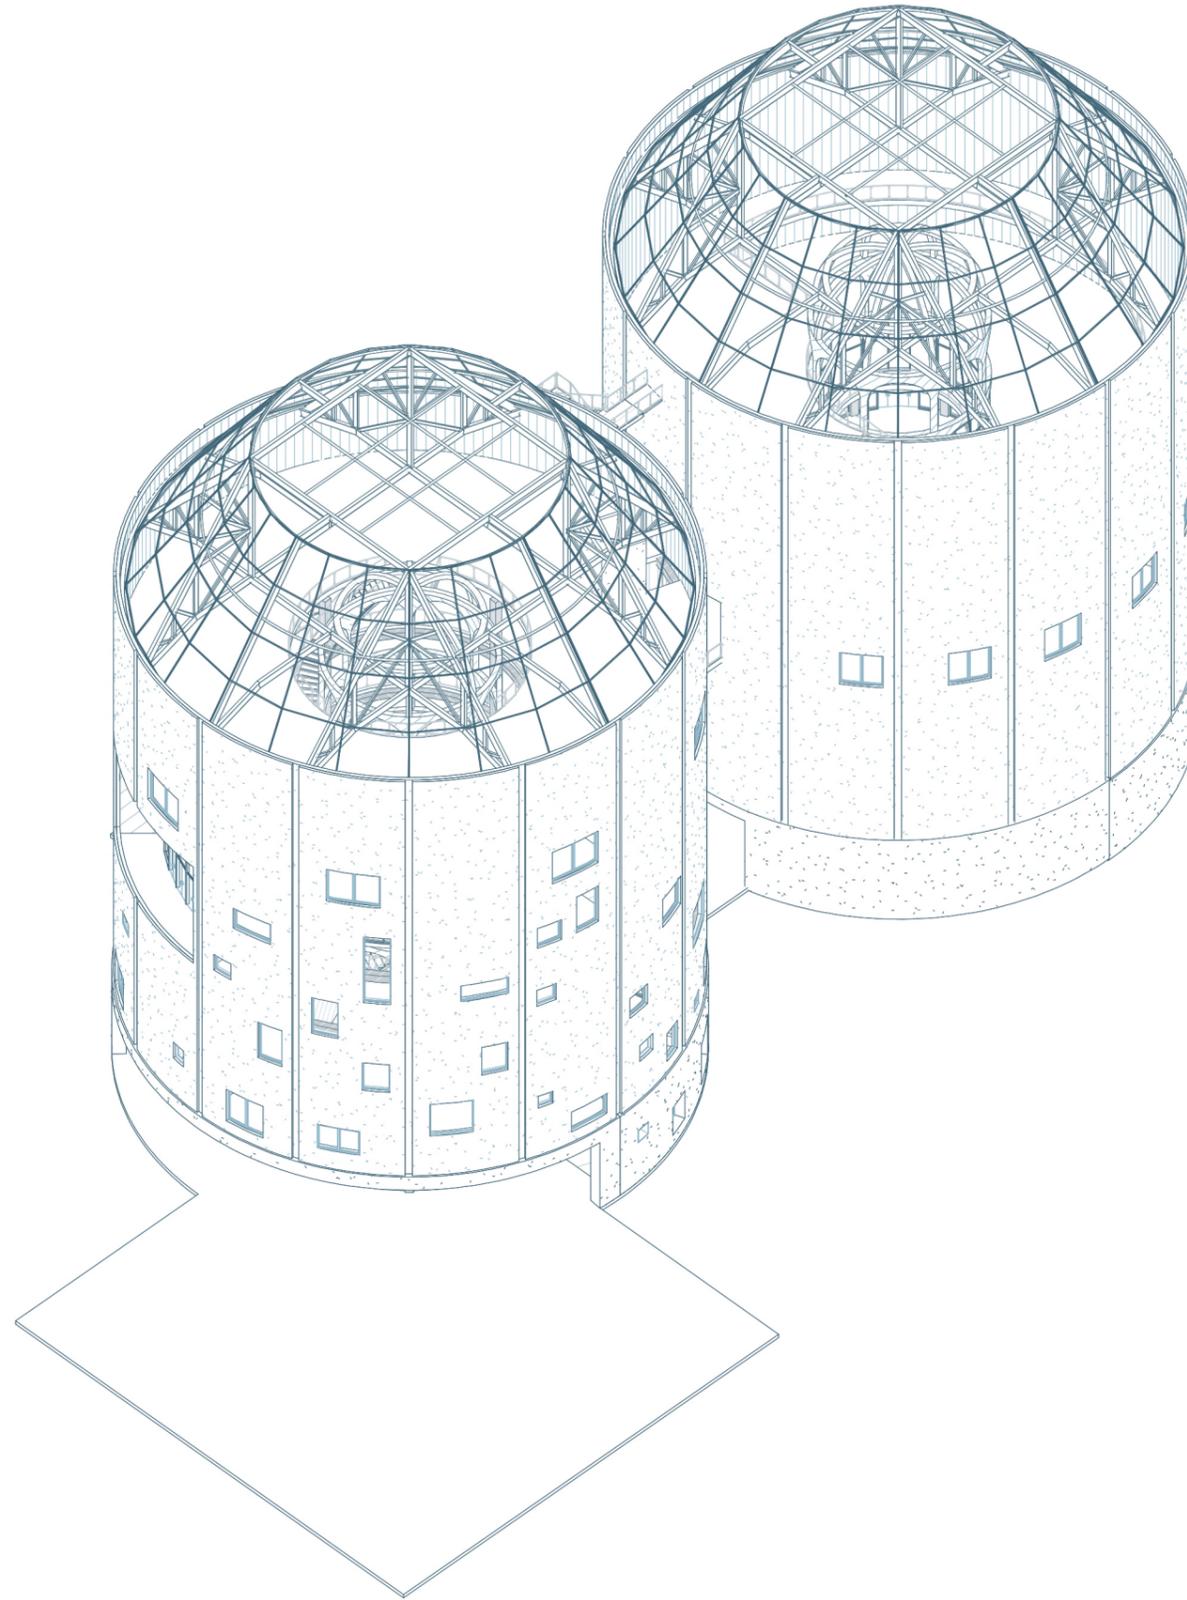

Installation of construction components through the roof and bottom openings. The Circular opening on the roof is of 17.5M, which means (most) construction components should be able to pass through it in plan. This would also define the compartments for fire proofing. Construction of central circulation system and other structure happen together followed by slabs and walls.

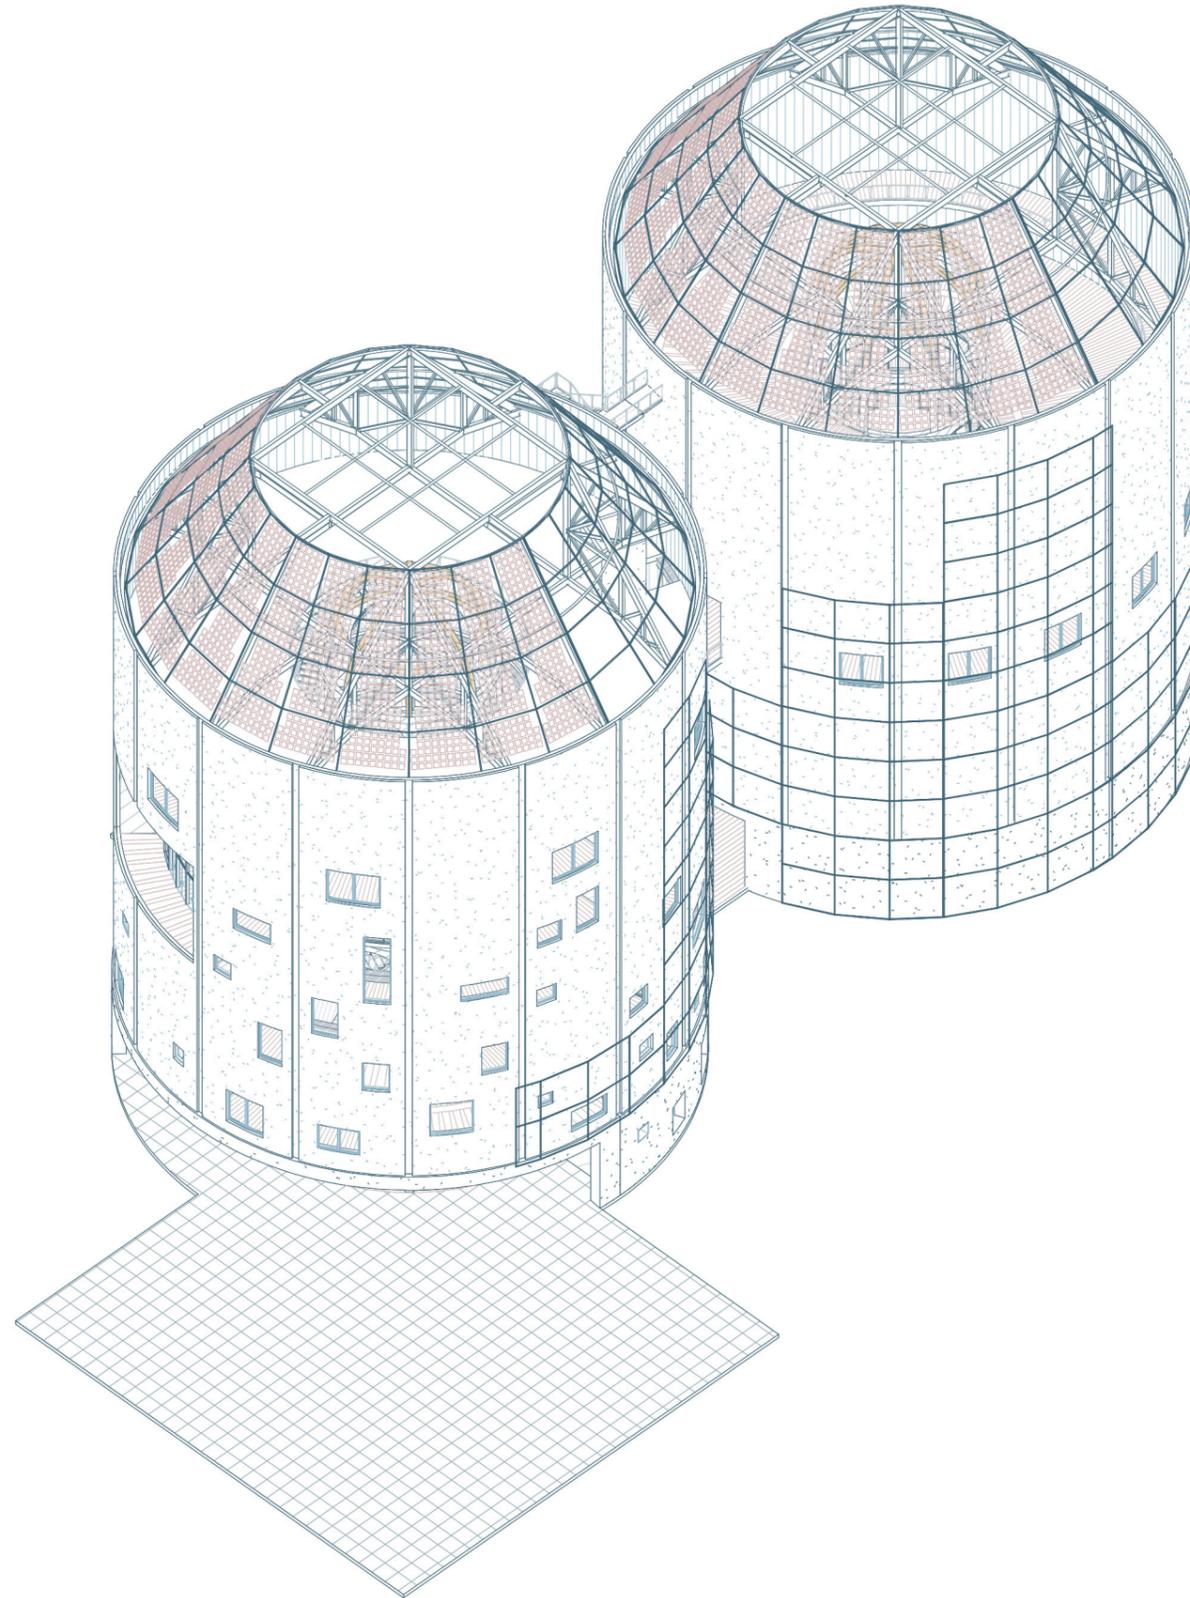

**Step 4:**  
Construction of the structure above.  
Addition of diagonal beams. The super  
structure along with the beams is built.

**Step 5:**  
Interiors, finishes and fenestrations.

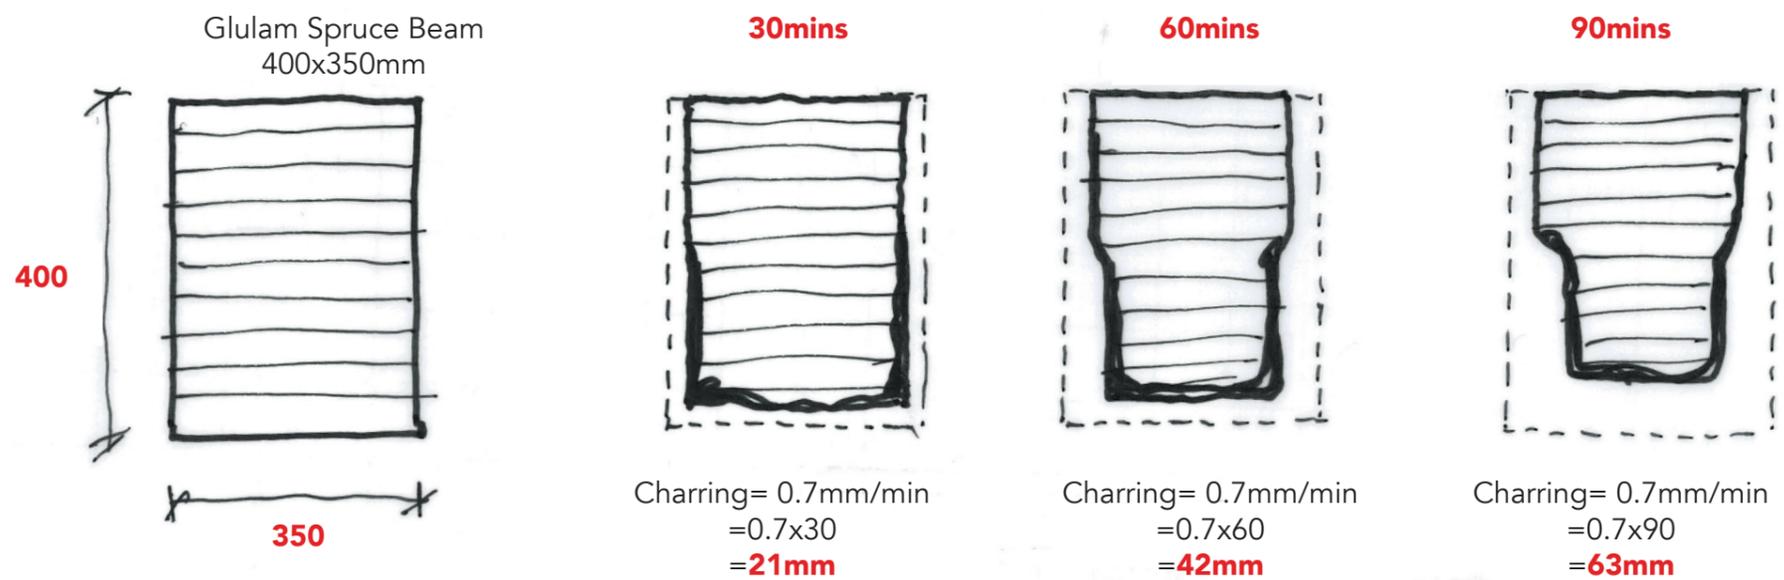

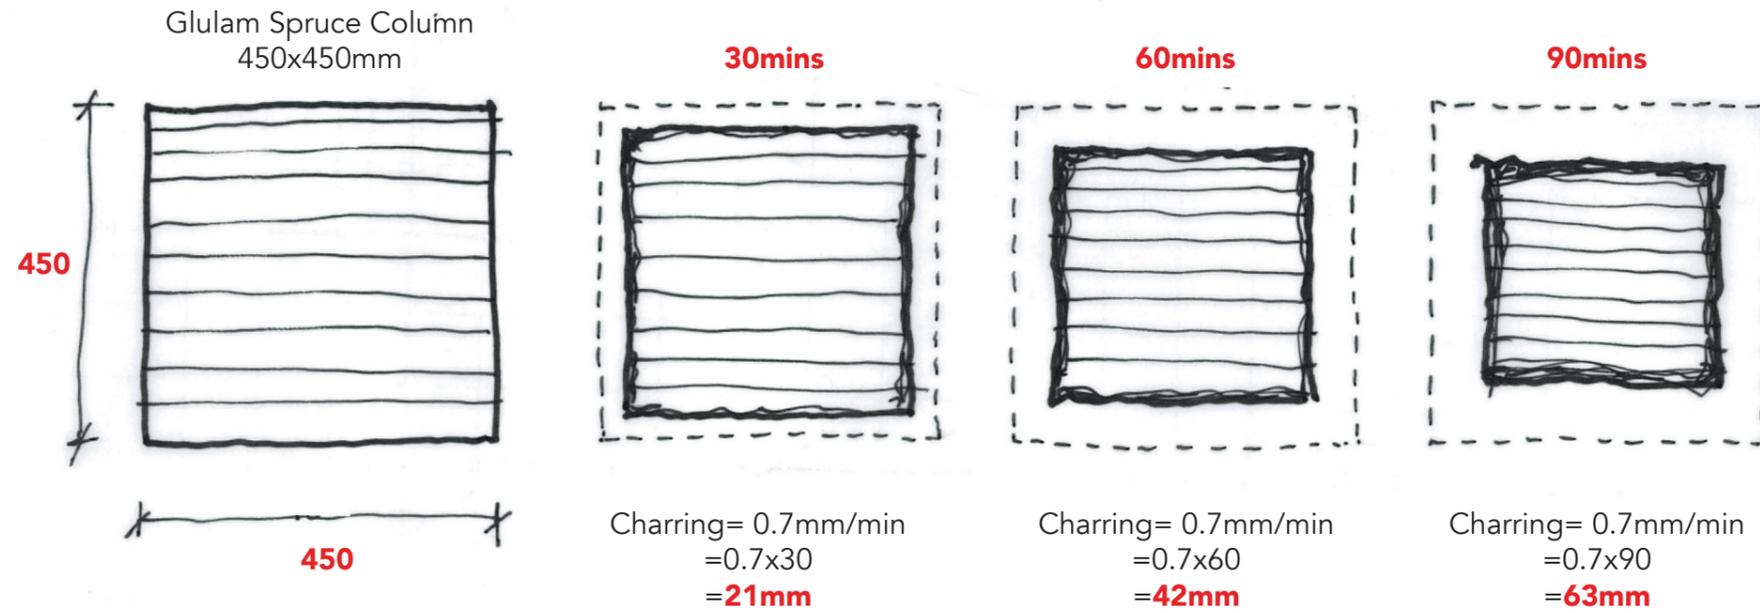

**Step 6:**  
Roofing (solar panels) and green facade.

# FIRE & MODULE

Structure is designed for total of 120mins.  
 90mins from the structure with an additional 30mins from  
 Hi-fog system and active fire-fighting.

**120mins**  
 Hi-fog sprinkler system.

## Summer

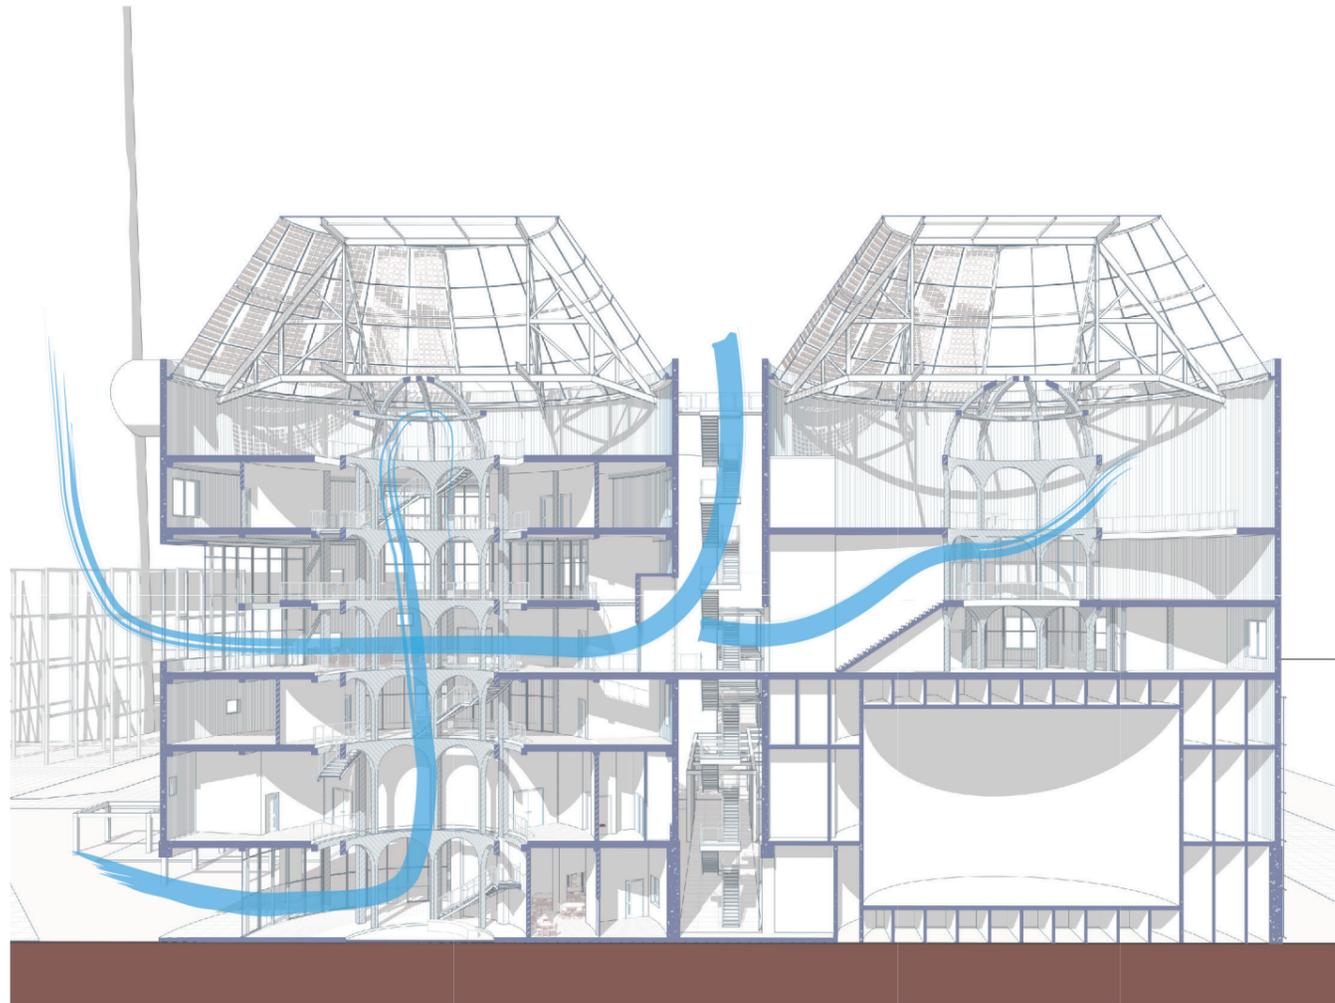

Opening up the terraces and various openings in the building to allow cross ventilation. Green facade blocks the harsh sunlight but allows the wind to go through, cooling down the interiors. Using the atrium space for vertical air-circulation.

Systems used for cooling:

Passive cross-ventilation.

Floor cooling. (During summer afternoons when temperatures sore around +26degree C, during that time water from the Underground water tank can be run through the pipes to cool the structure)

Mechanical Ventilation system

## Winter

The central atrium helps in ventilation and heat trapped from the transparent solar panel roof and terraces help heat up the interiors. Heat is supplied from the basalt battery.

Systems used for heating:

Floor heating.

Mechanical ventilation system.

Thermal insulation.
