

# THE INTEGRATION OF FOREST ECOLOGIES INTO THE URBAN ENVIRONMENT

Ruben Koppes  
4727681

Architectural Engineering  
Urban Forestry

**Personal Information**

Name: Ruben Koppes  
Student number: 4727681

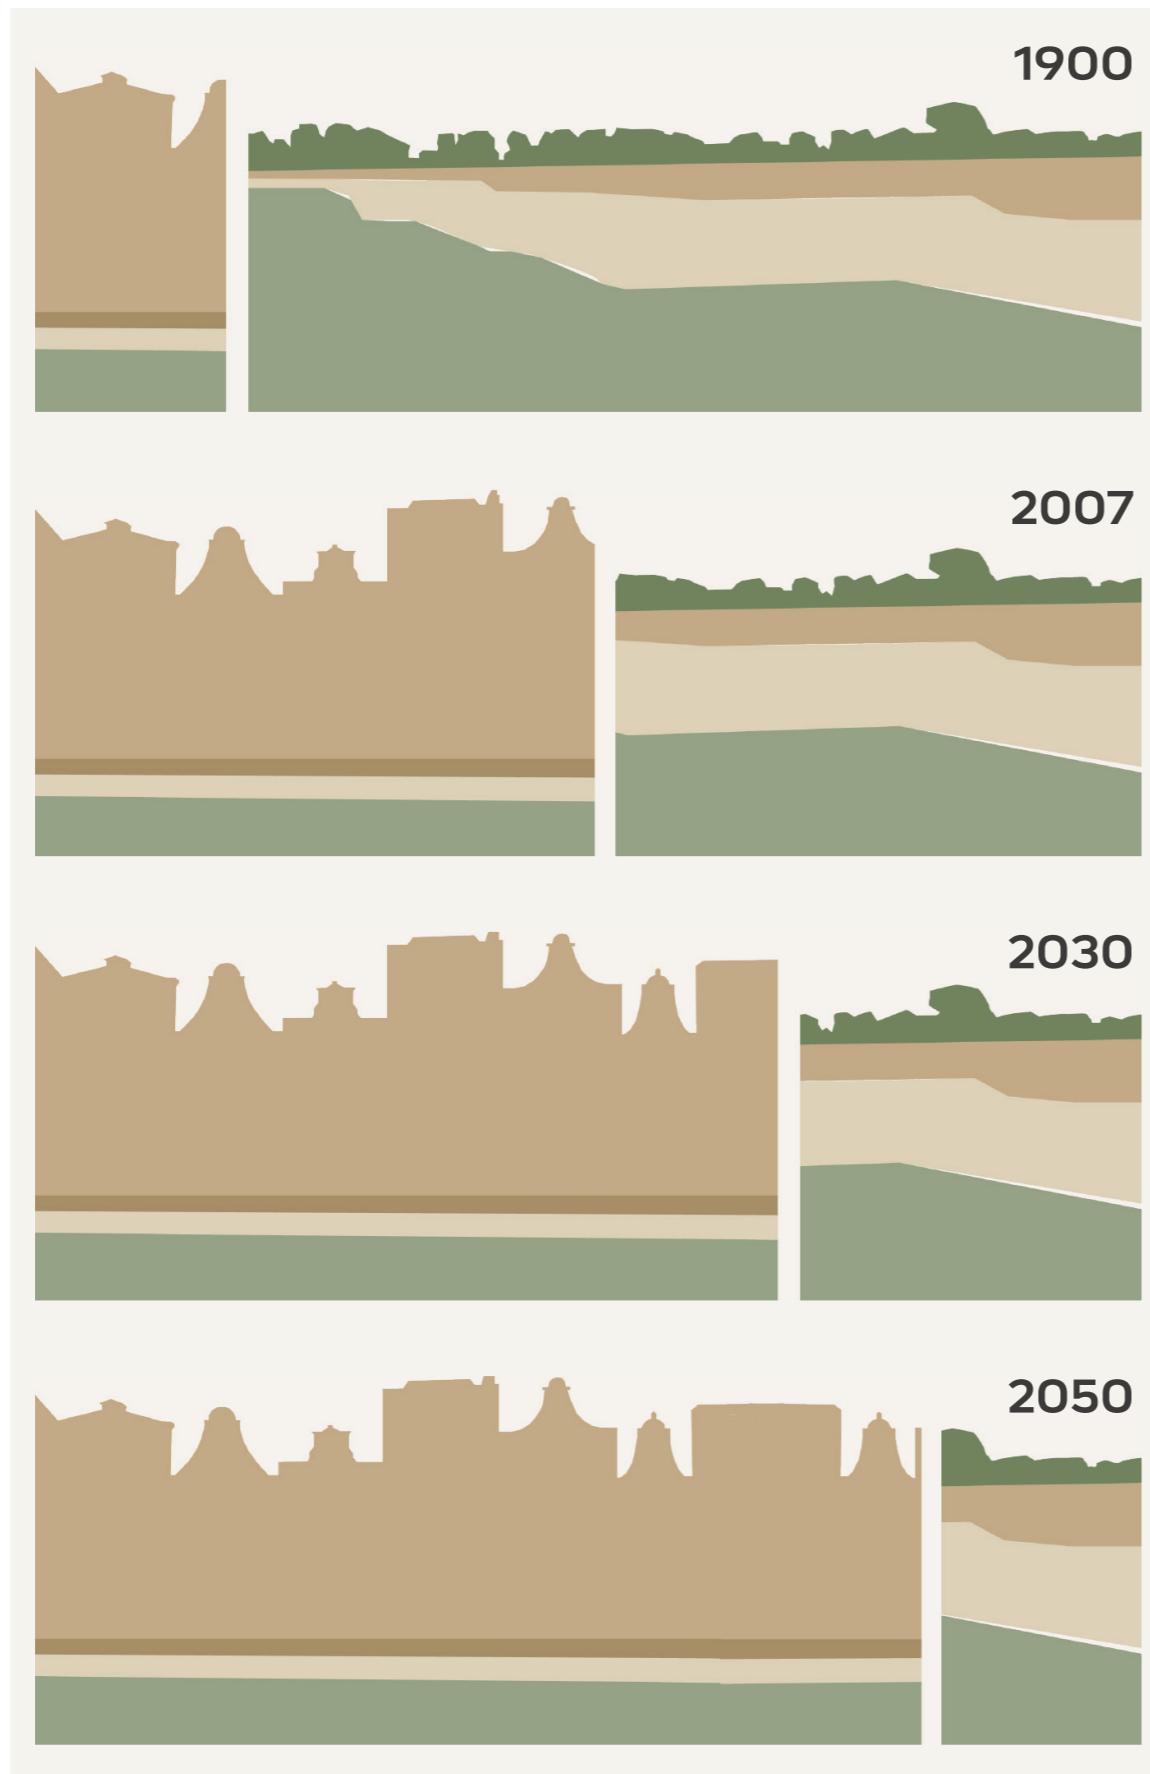

**Studio**

Name of studio: Architectural Engineering  
Design tutor: Mo Smit  
Research tutor: Pierre Jennen  
Building technology tutor: Gilbert Koskamp  
Delegate examiner: Andre Mulder

**Title**

The integration of forest ecologies into the urban environment.

# PROBLEM STATEMENT

Lack of biodiversity

CO<sub>2</sub> and dust pollution

Noise pollution

Stormwater flooding

Heat stress

Lack of identity

Less availability of fresh water

Psychological problems  
Integration problems

(RIVM, 2010)

**To design an ecological and integrated neighbourhood in a wetland forest landscape, where both landscapes are benefitting from each other's ecosystem services**

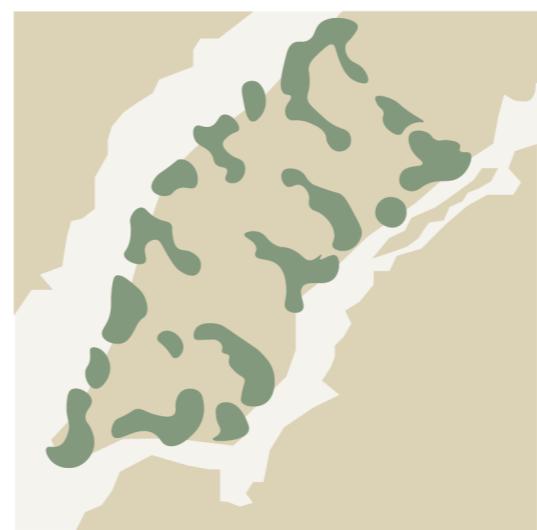

Thematic research question: "How can urban ecologies and forest ecologies be integrated?"

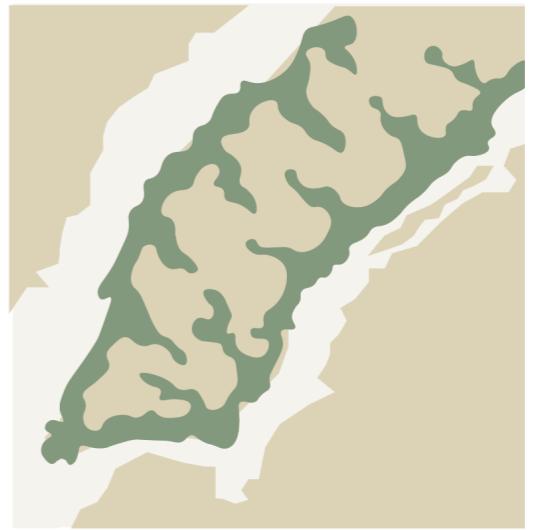

Centralised planting

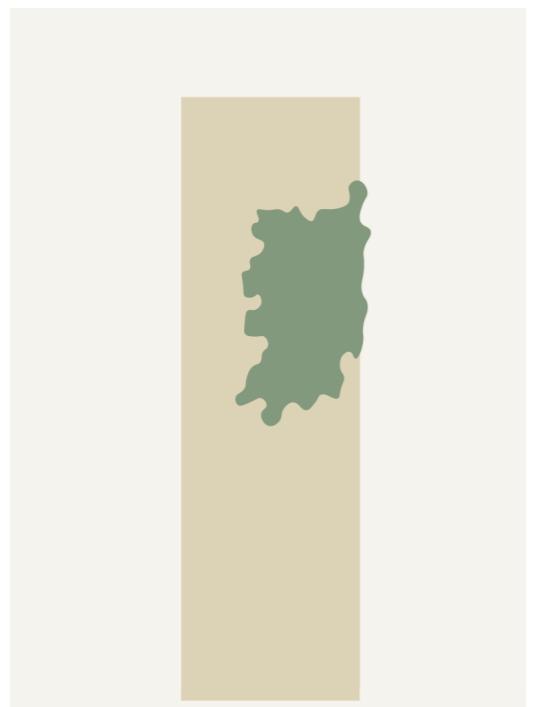

Dispersed planting  
"spotty" pattern

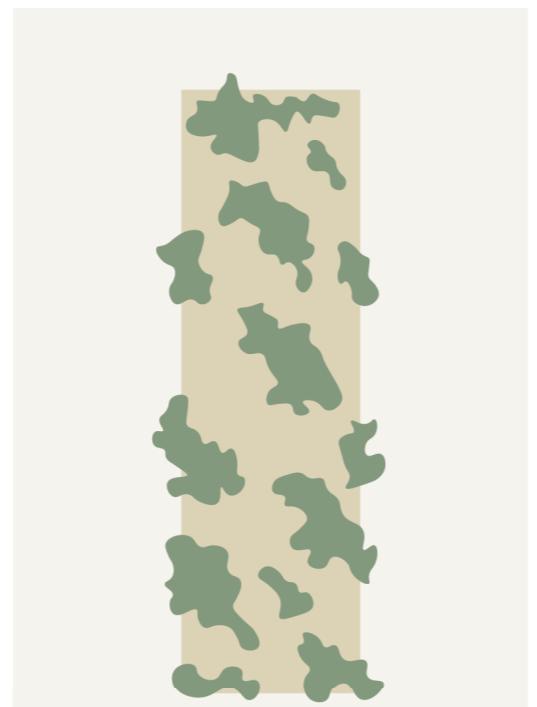

"Stepping stones"

**Link existing natural corridors**  
Continuous planting  
"corridors and fingers"

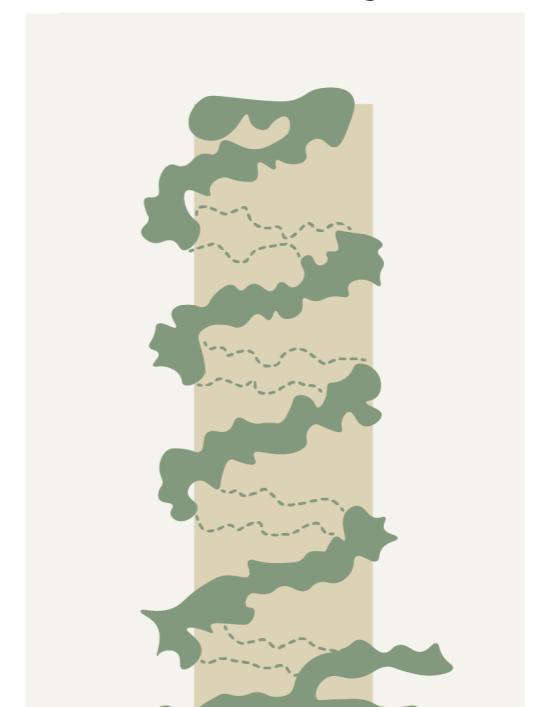

Juxtapositioning

Intermixing

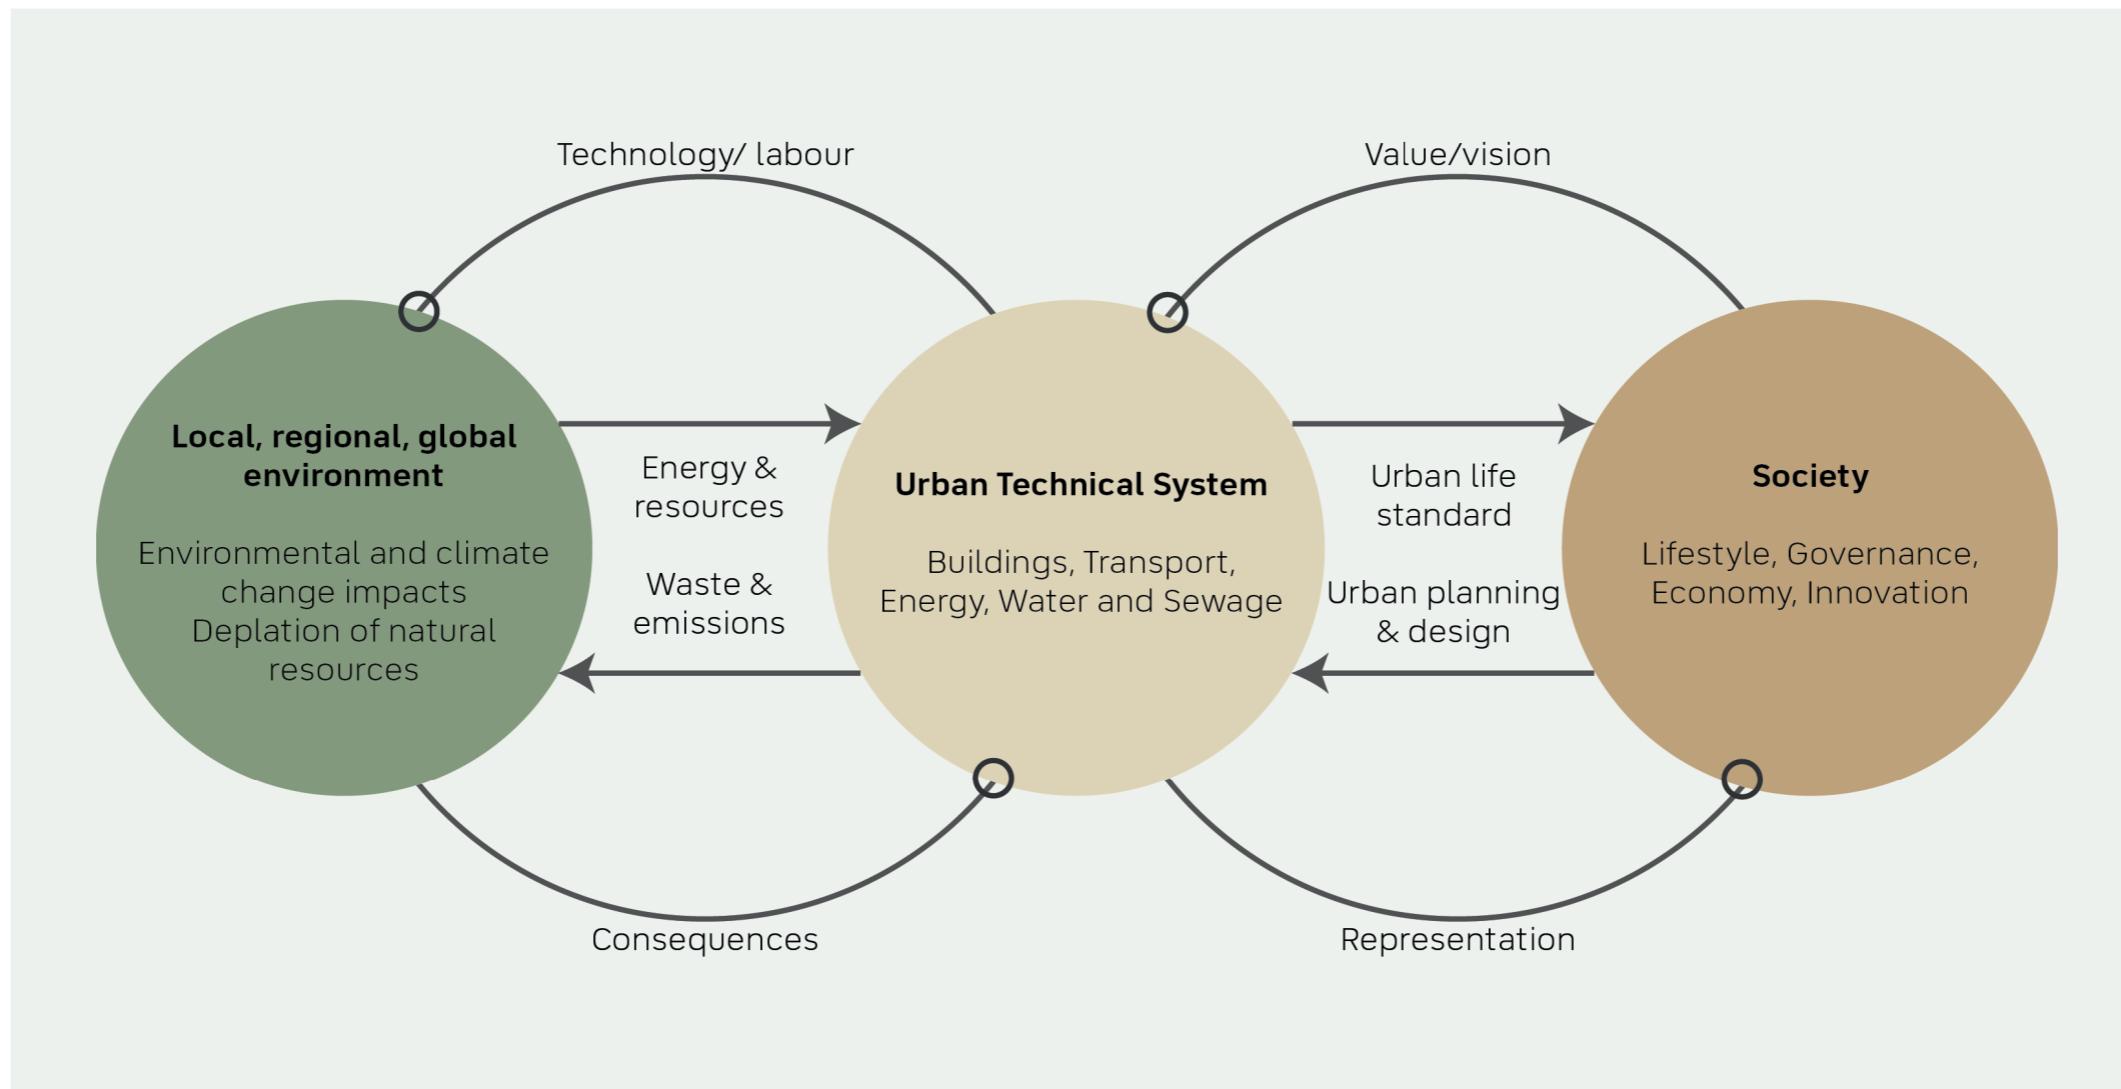

Enhanced intermixing

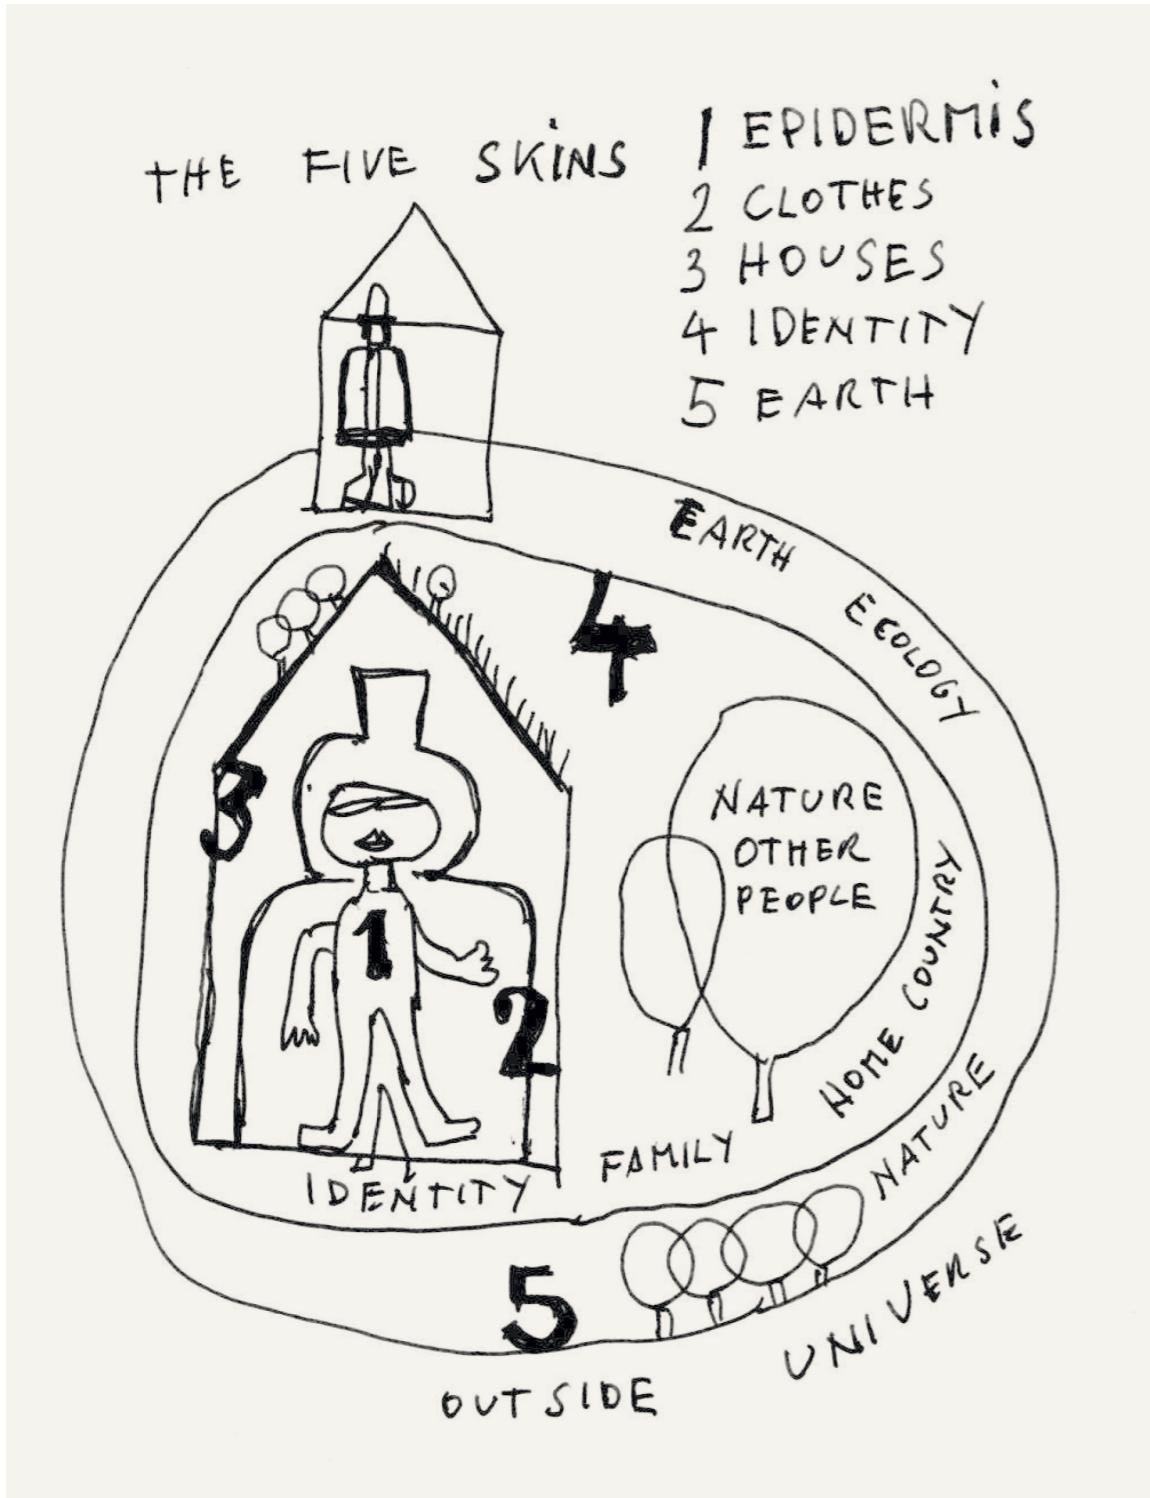

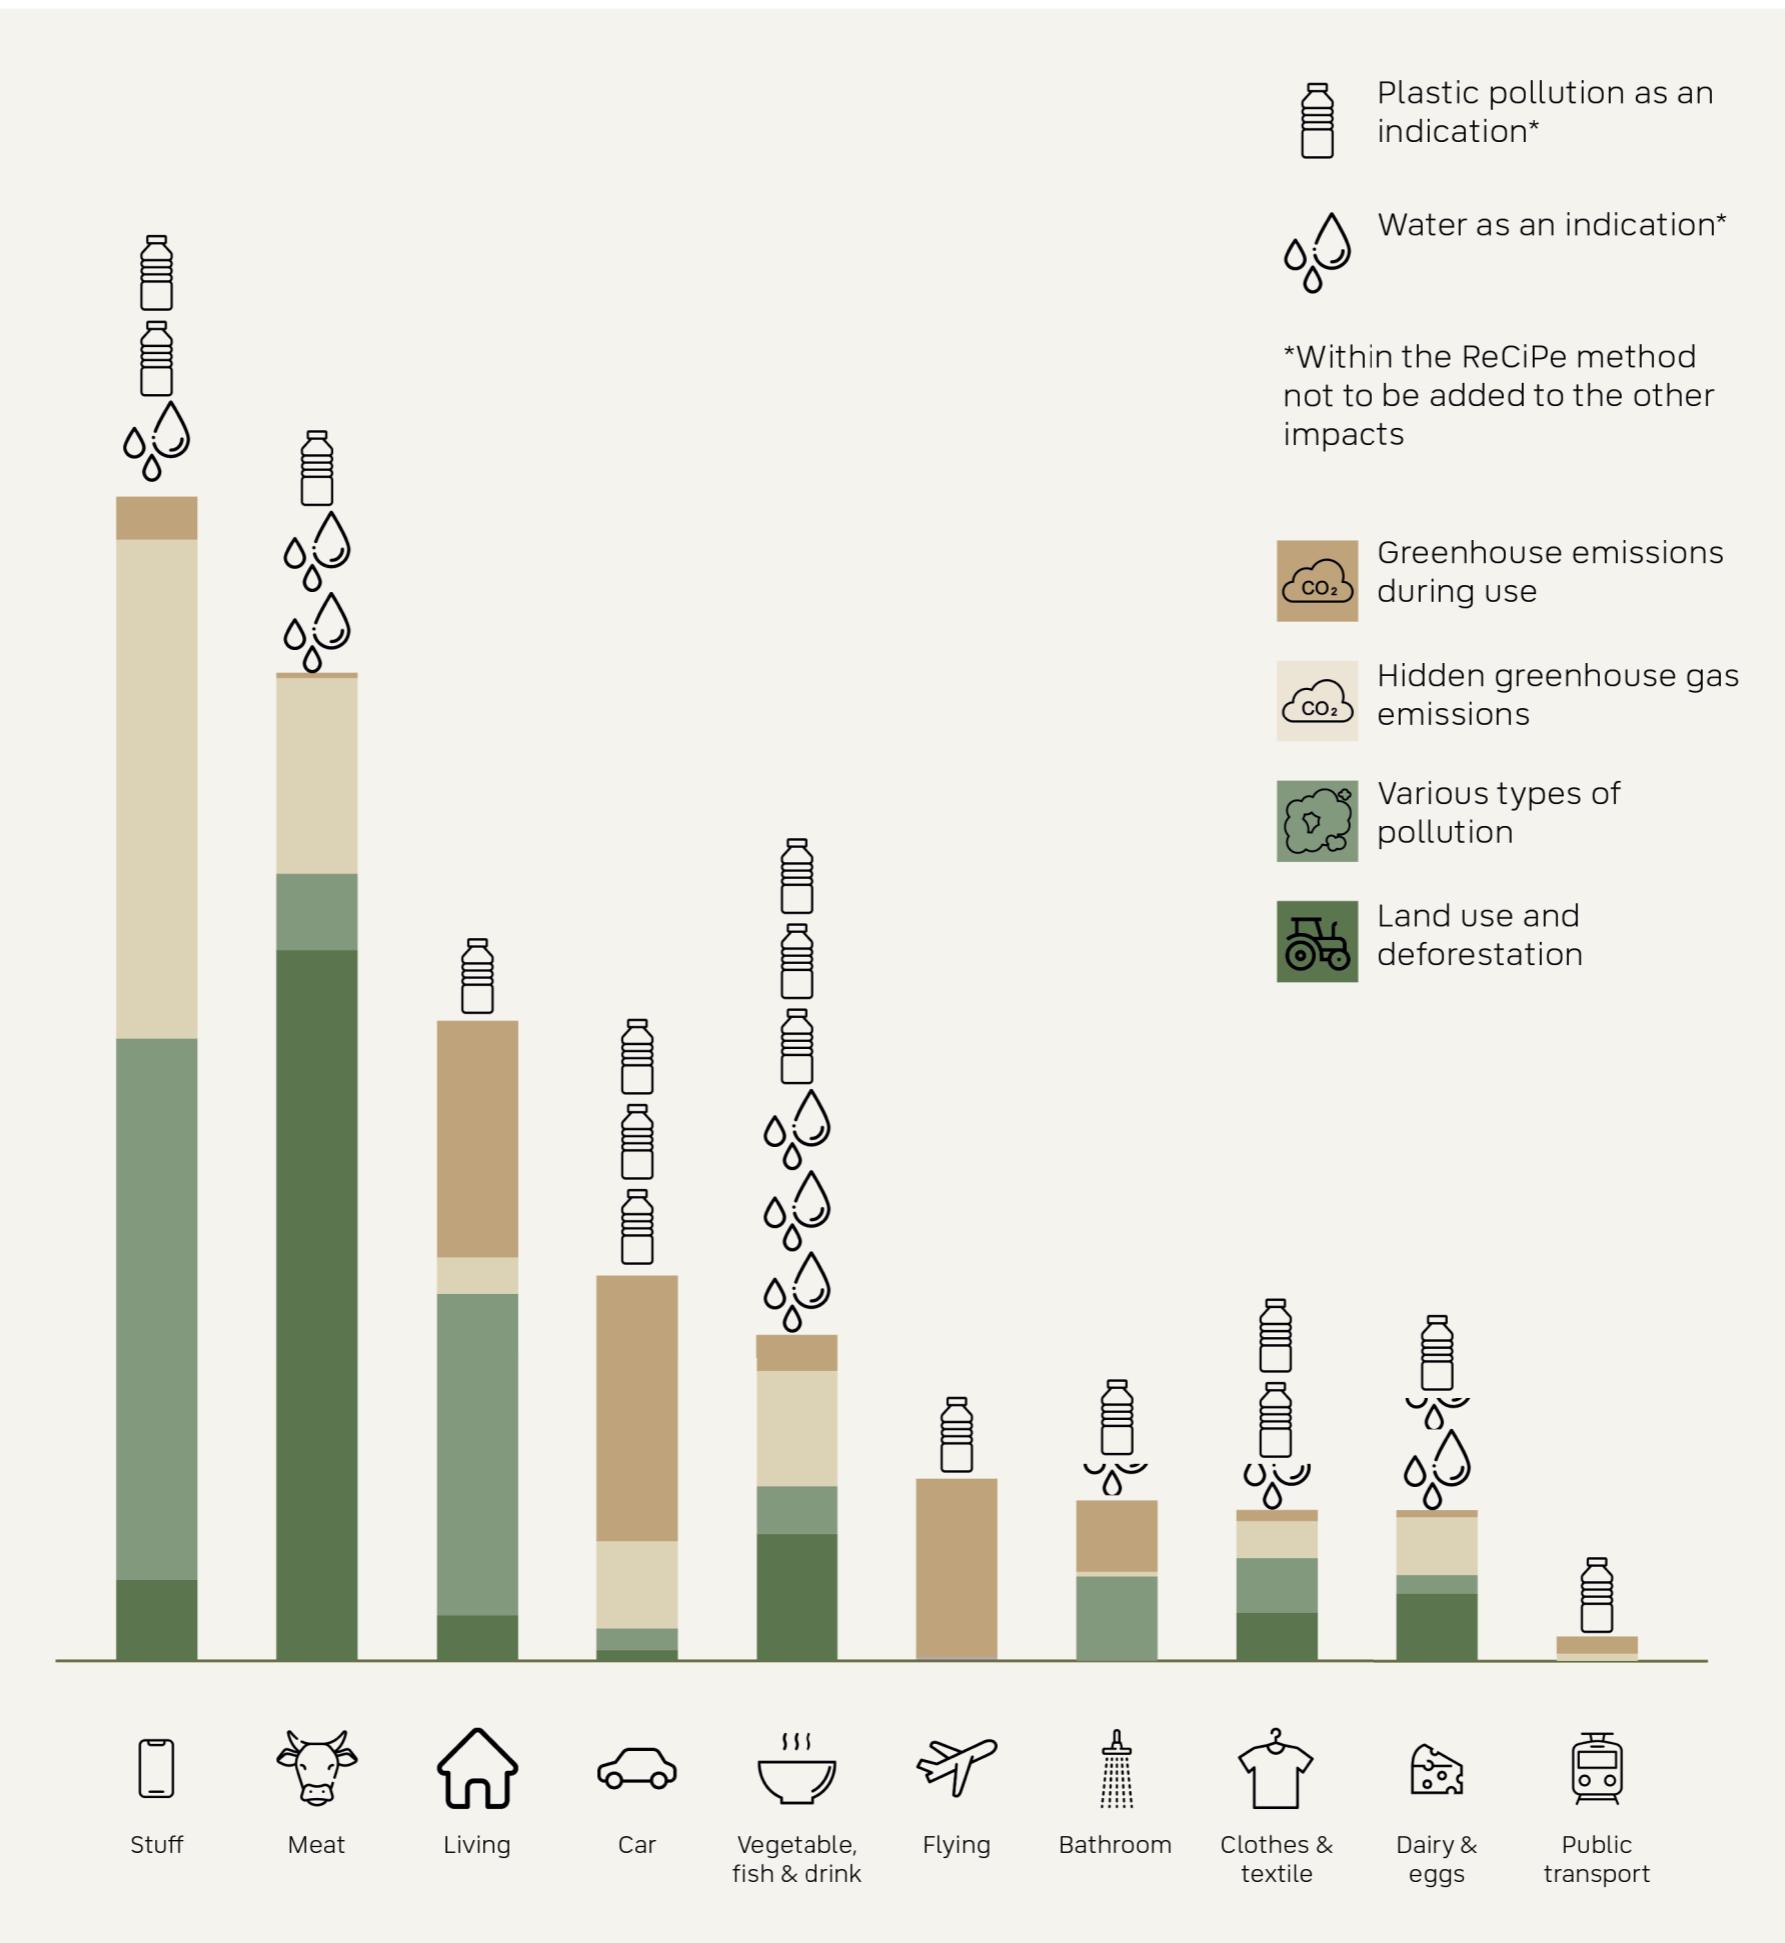

**Integrating**

(Yeang, 2018)

(European Environment Agency, 2020)

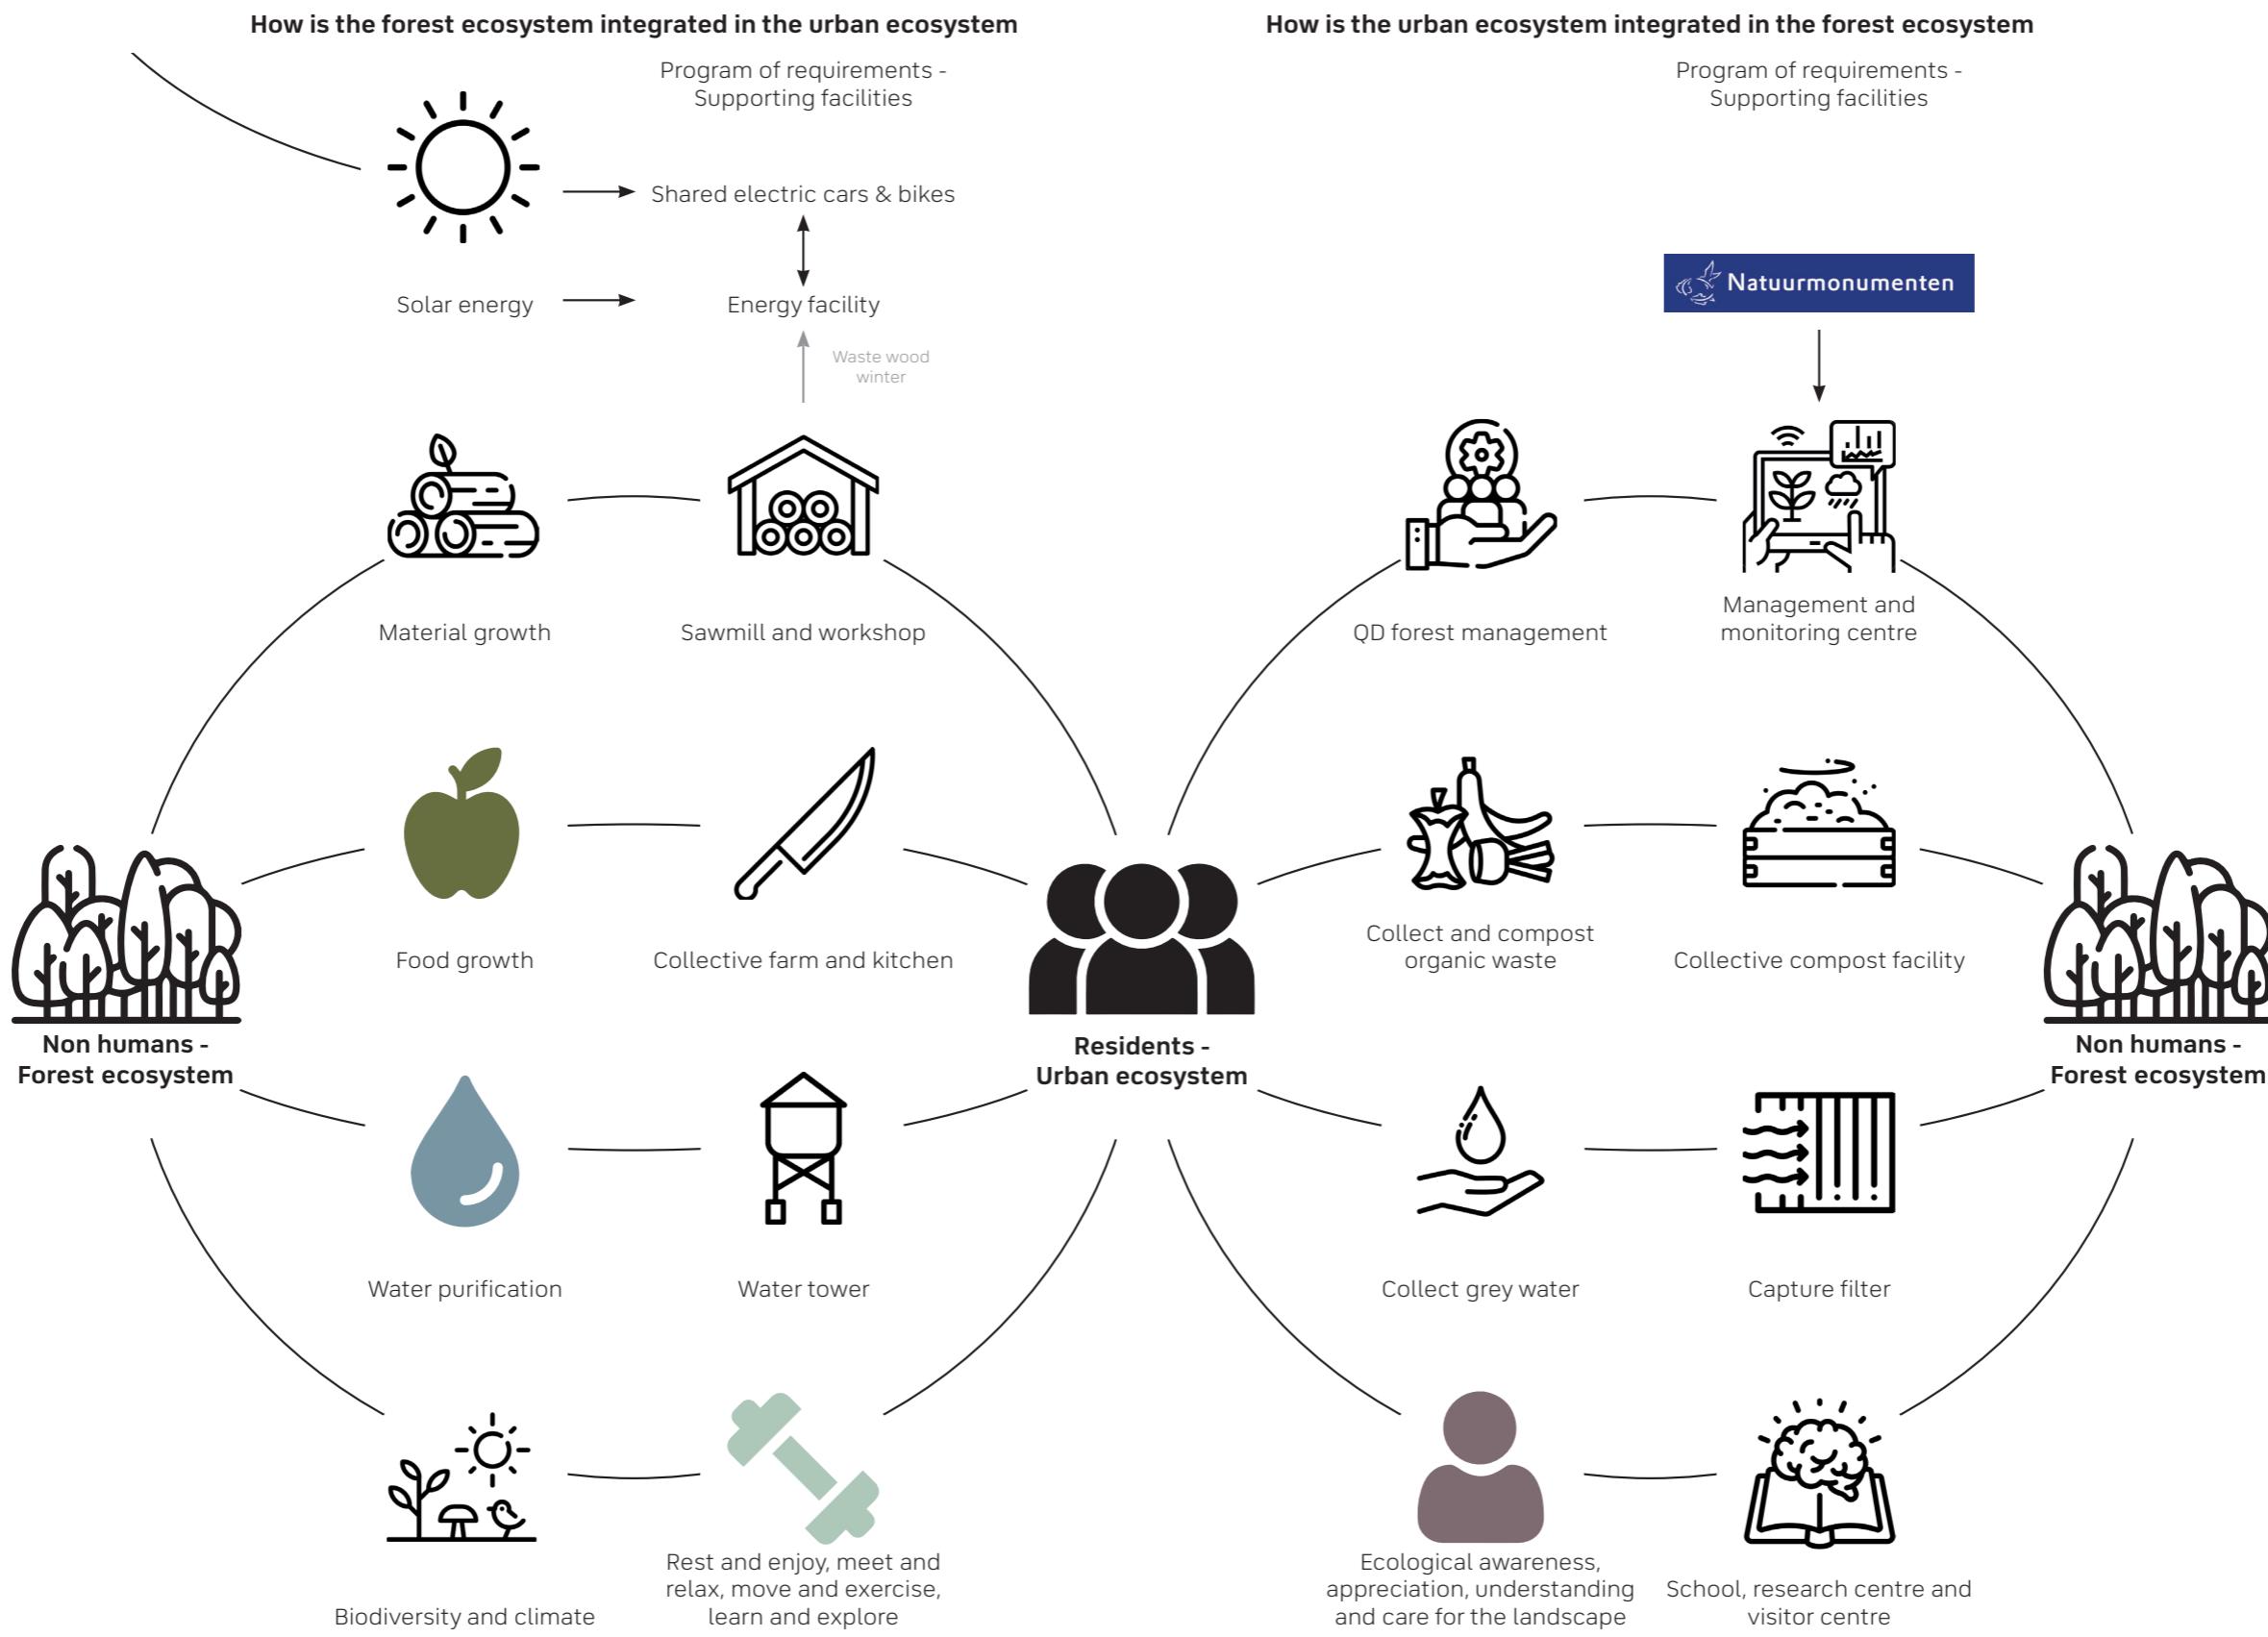

(Porcelijn, 2016)

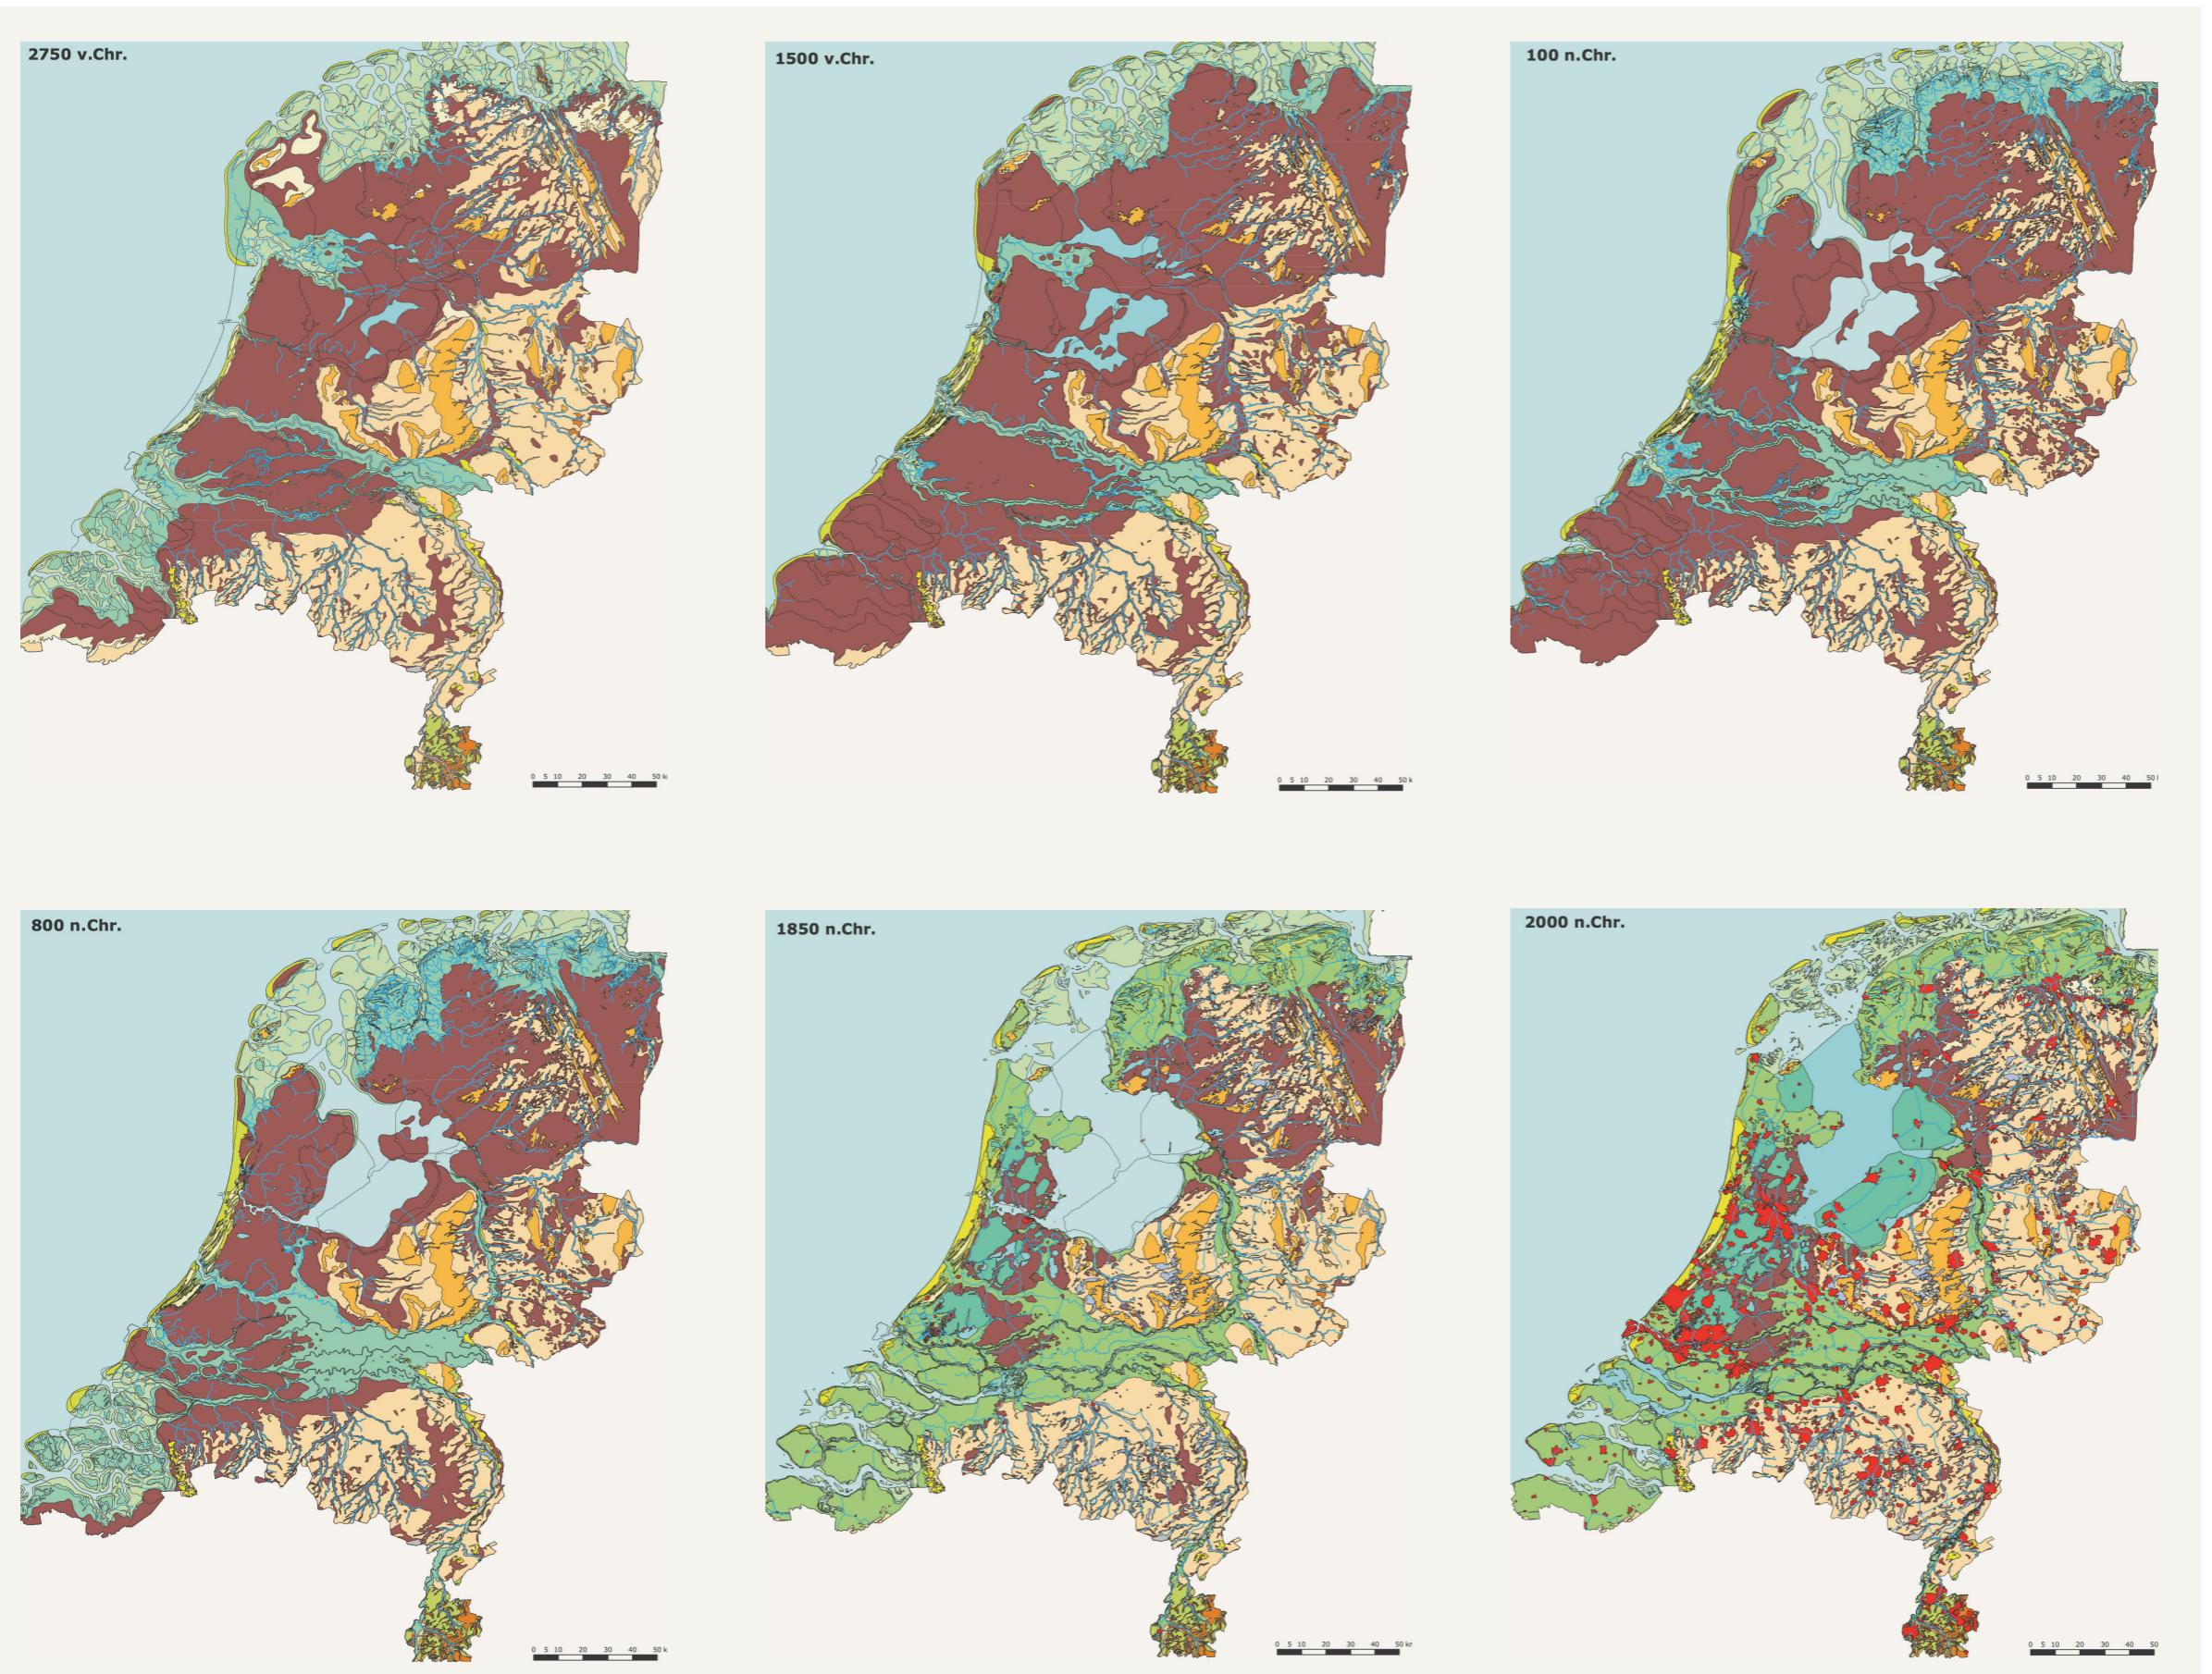

(Sociaal en Cultureel Planbureau & Roeters, 2018, Rijksinstituut voor Volksgezondheid en Milieu, 2018)

# **SITE AMSTERDAM IJBURG BUITENEILAND**

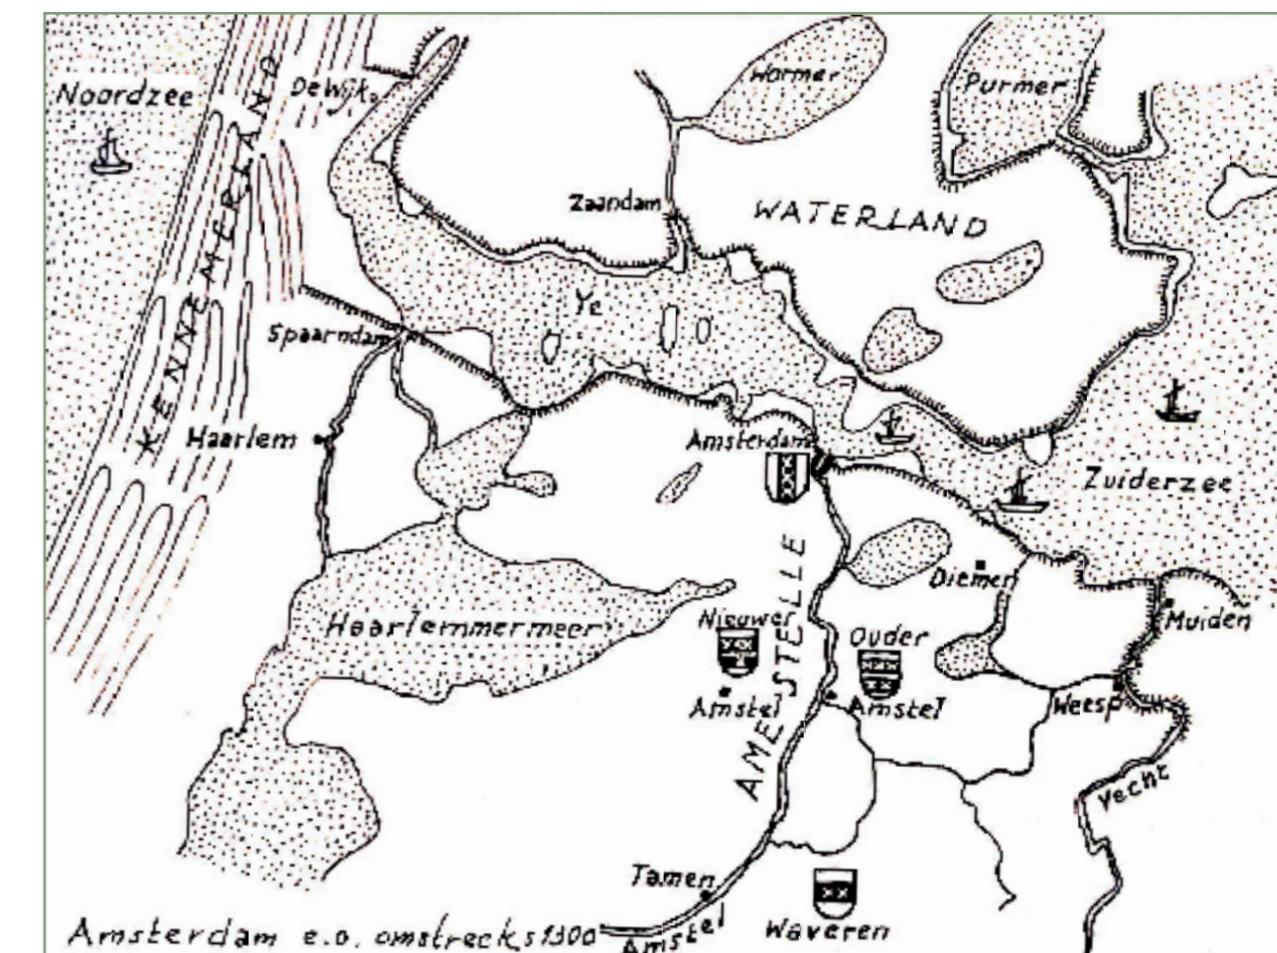

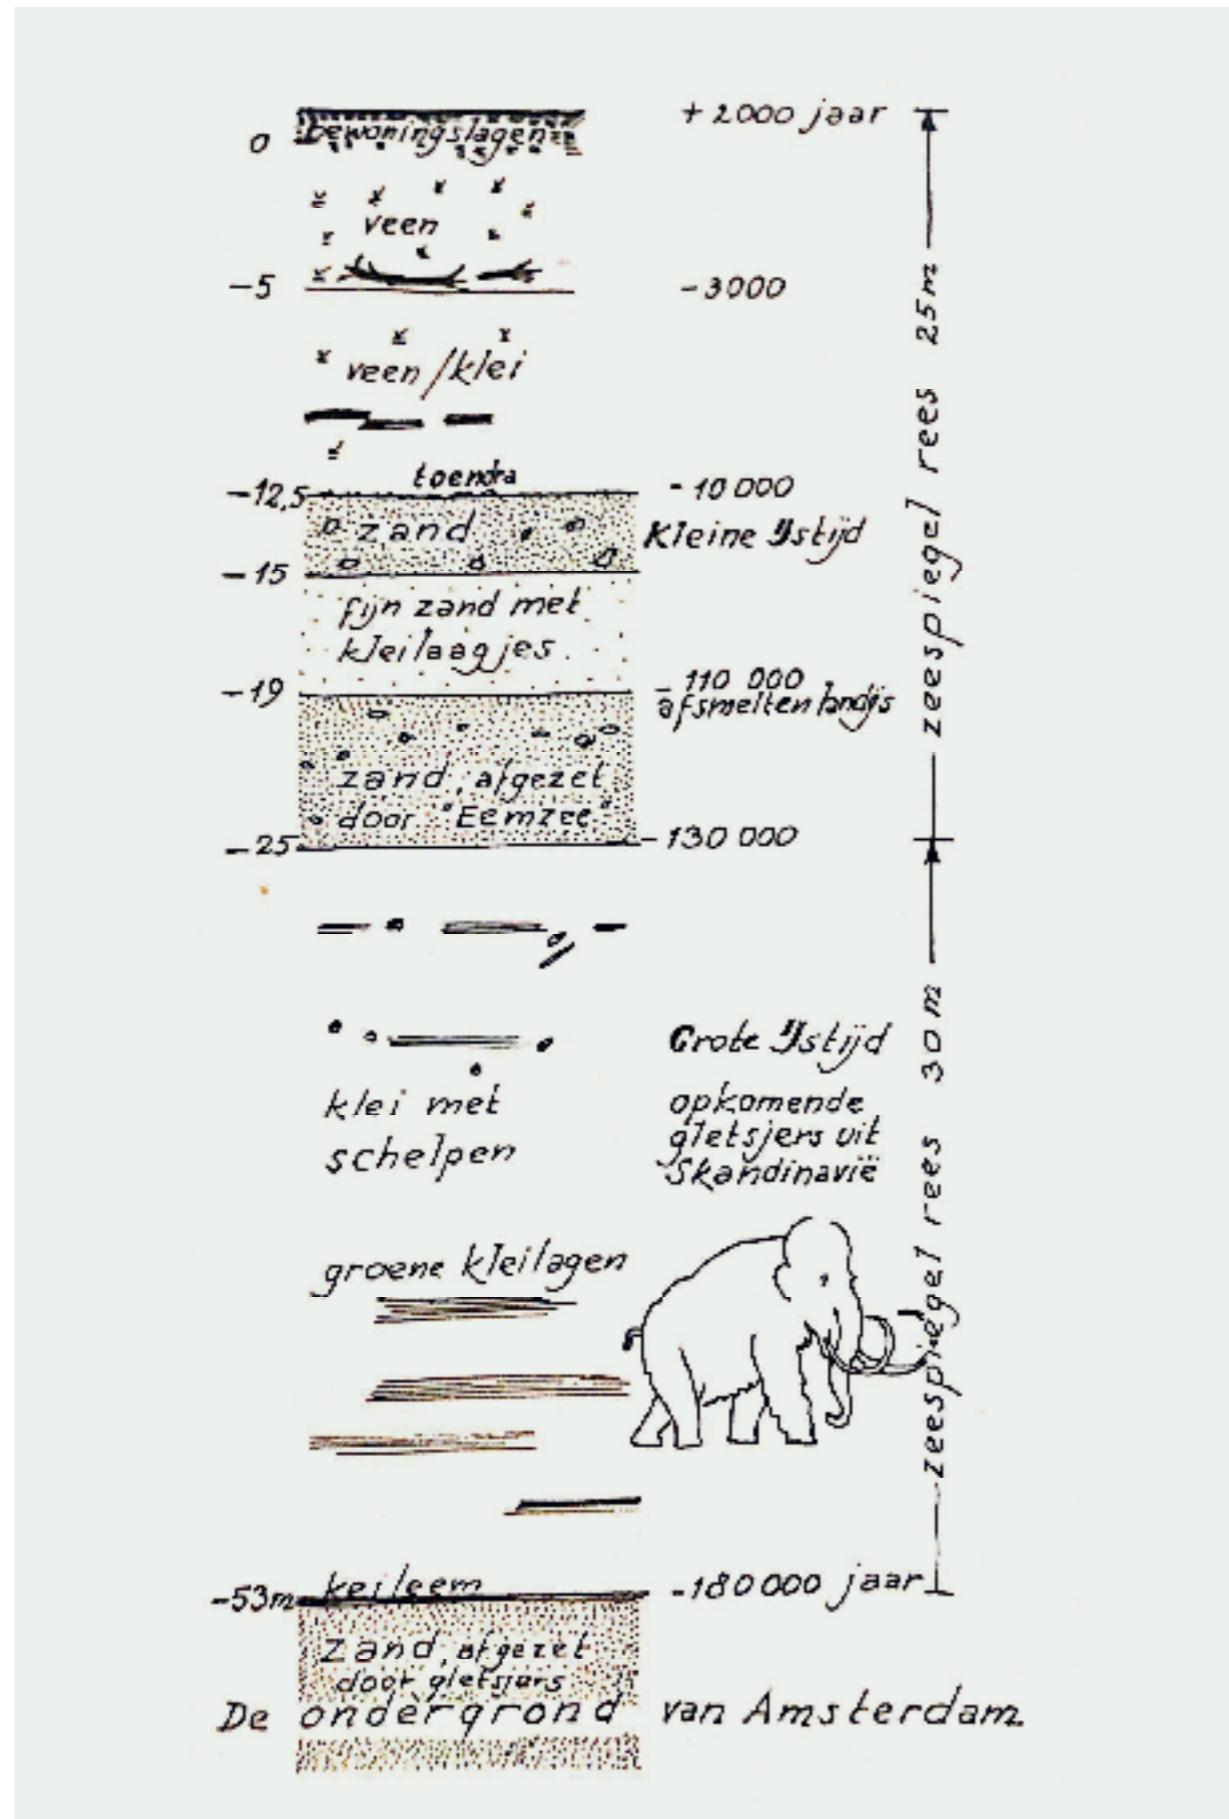

### Holocene landscape

- High dunes
- Beach ridges and long dunes
- Beach plains and dune valleys
- Tidal flats and mudflats
- Salt marshes and river plains
- Areas with salt marshes and ridges
- Peatland area
- Embanked salt marshes and river plains
- Droogmakerij
- Urban area

### Pleistocene landscape

- External and internal water
- Pleistocene sandy areas, below 16m. -NAP
- Pleistocene sandy areas, below 16 and Om. -NAP
- Pleistocene sandy areas, above Om. NAP
- River plain and stream valleys
- Riverdunes
- Löss area
- Weirs, pushed boulder clay and ridges and valleys modelled by flowing land ice
- Areas with Tertiary and older deposits
- Drift-sand

(Rijksdienst voor het Cultuur-Erfgoed, TNO, & Deltares, 2020)

Various wetland species: ronde zonnedauw, gele lis, koekoesbloemen, veenpluis, koekoeksbloem, moeraskartelbald, orchideeen, zegge, waterzuring, watermunt, riet, watergentiaan, kikkerbeet, krabbenscheer, waterlelie.

Various wetland species: lepelaar, kwak, bruine kiekendief, roerdomp, woudaapje, porseleinenhoen, blauwborst, kleine karekiet, bosrietzanger, blankvoorn, modderkruiper, snoek, otter, dwergmuis, boomarter, libellen, ruggenzwemmers, kokerjuffers, oranjetipje, zilveren maan.

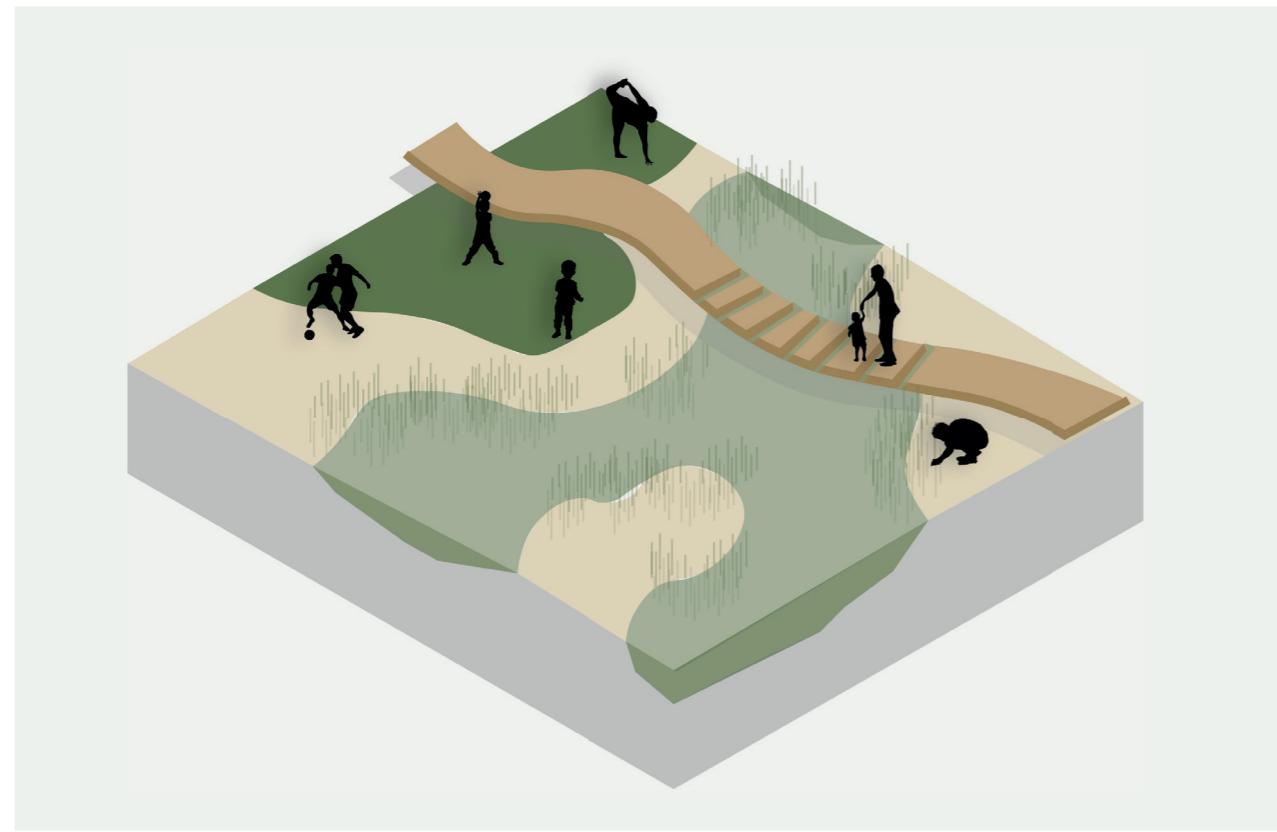

North elevation forest dwelling  
(Royal HaskoningDHV, 2017, Wageningen University & Didde, 2020)

## Wetland as local food forest

East elevation wetland dwelling  
(Voedselmoeras Den Haag, 2021)

**Play and discover**

**Eating and meeting**

# **How to develop a new wetland forest ecosystem on a 'manmade' sandy island?**

Breeding areas

-0,7/-1,0m NAP  
calm water areas

Food supply

0,0--0,4m NAP  
variable water level  
wetland

Resting areas

0,0/+1,0m NAP  
Riparian forest

Year 0 - Start construction island by raising sand ridges

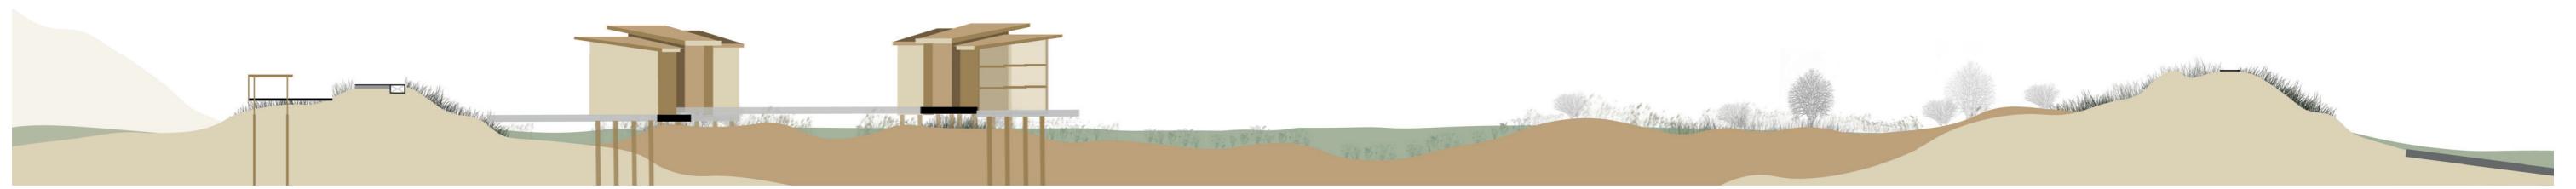

Year 0 - 3 - Anchor the sandridges with stones and vegetation. Fill the area between the sandridges by spraying on excessive silt from the bottom of the IJmeer.

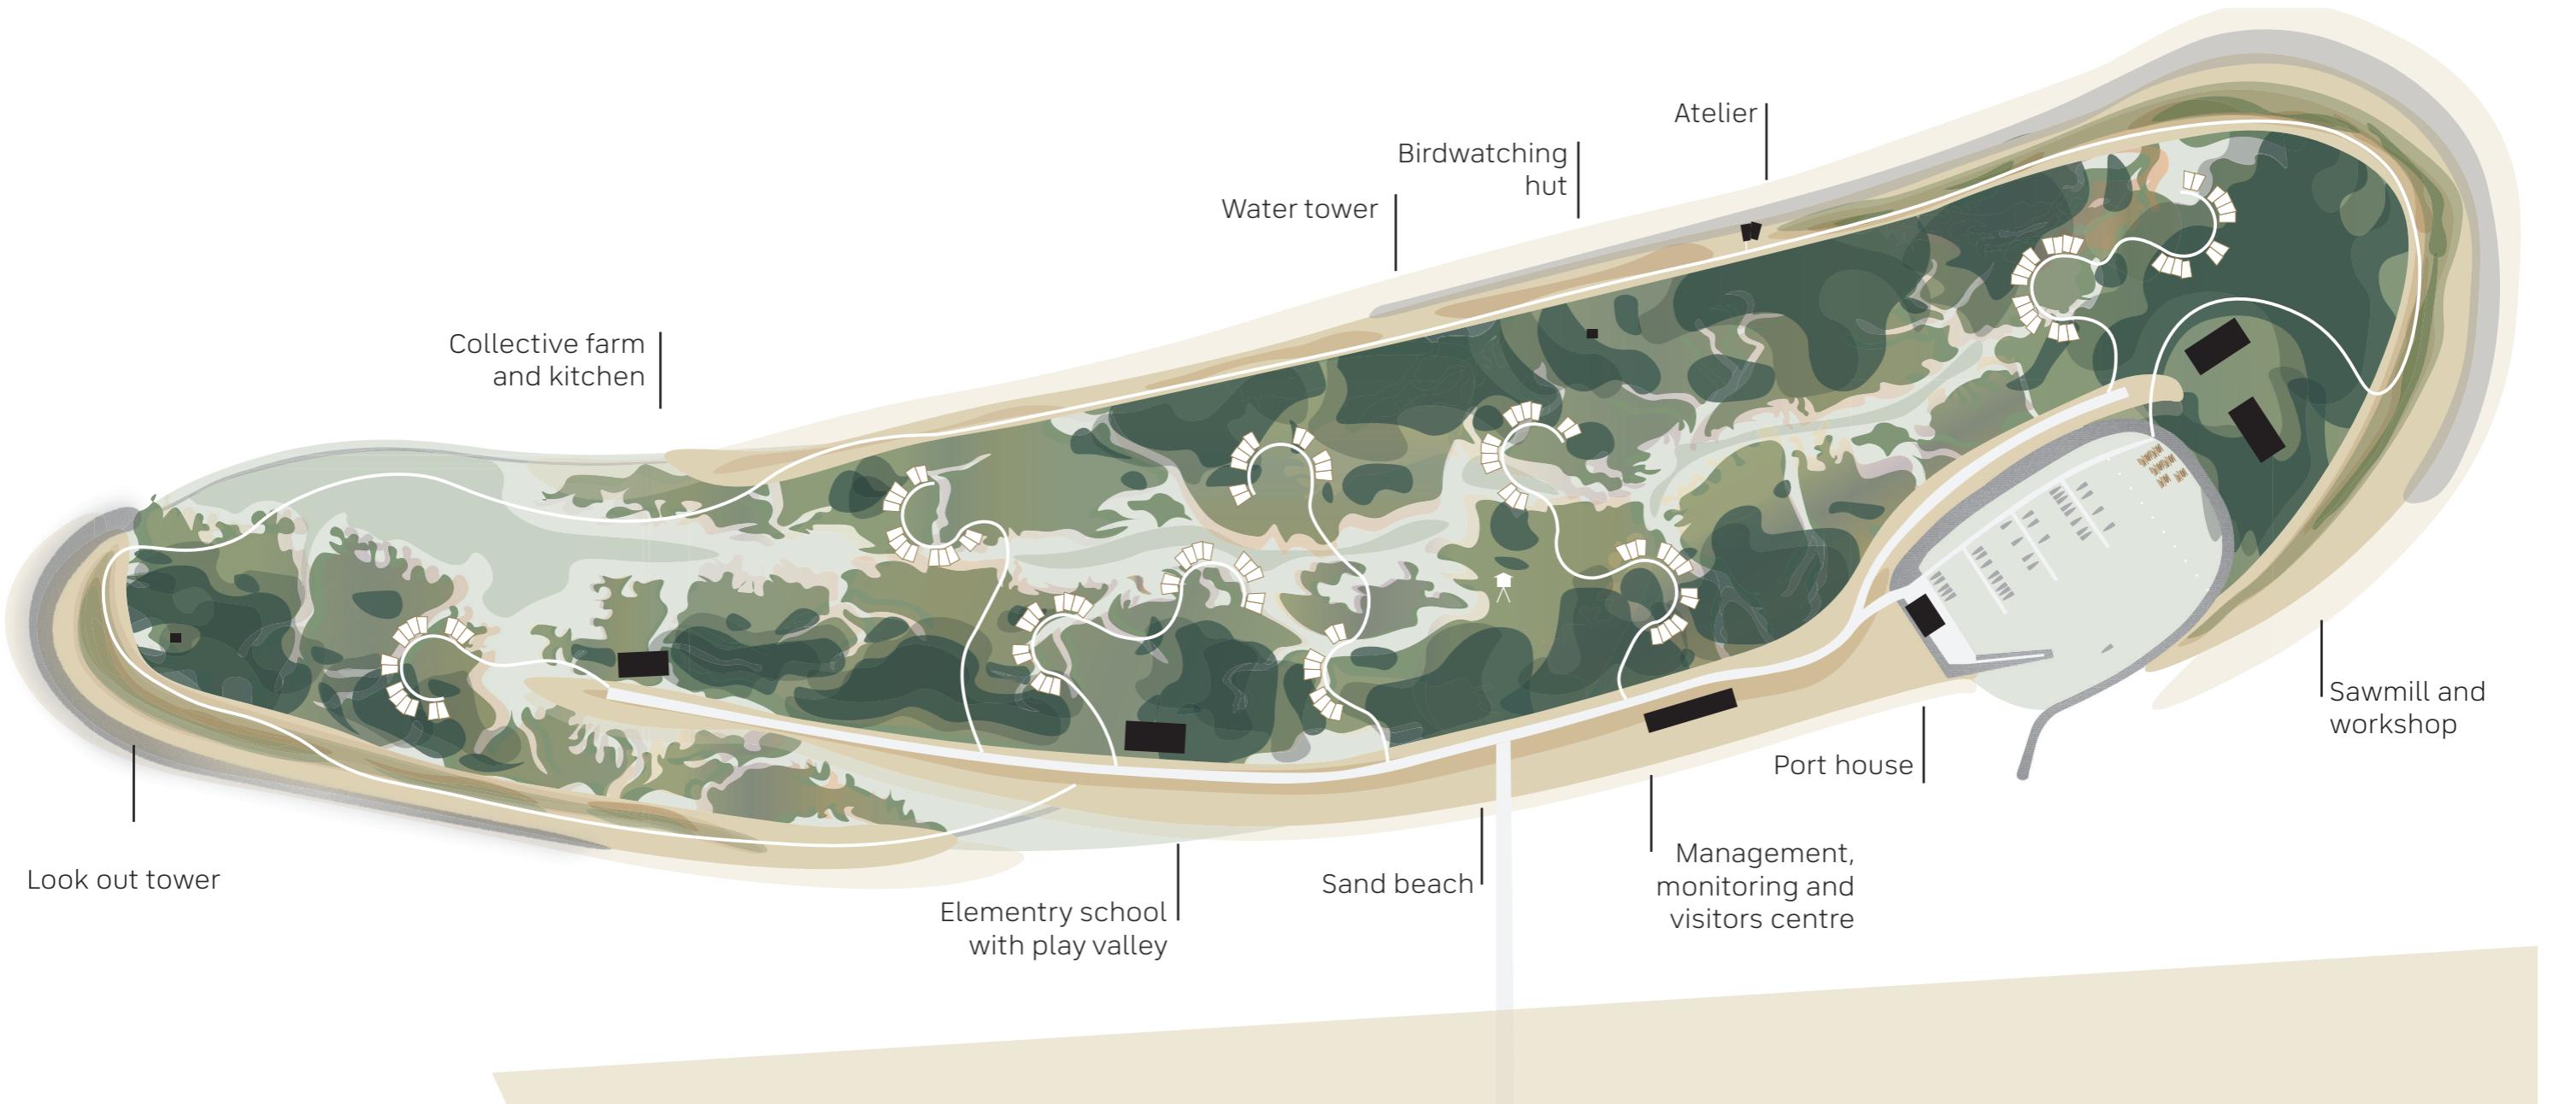

Year 5 - Plant diverse underwater plants, grasses and shrubs to start the first ecological processes by attracting, insects, birds and fishes.

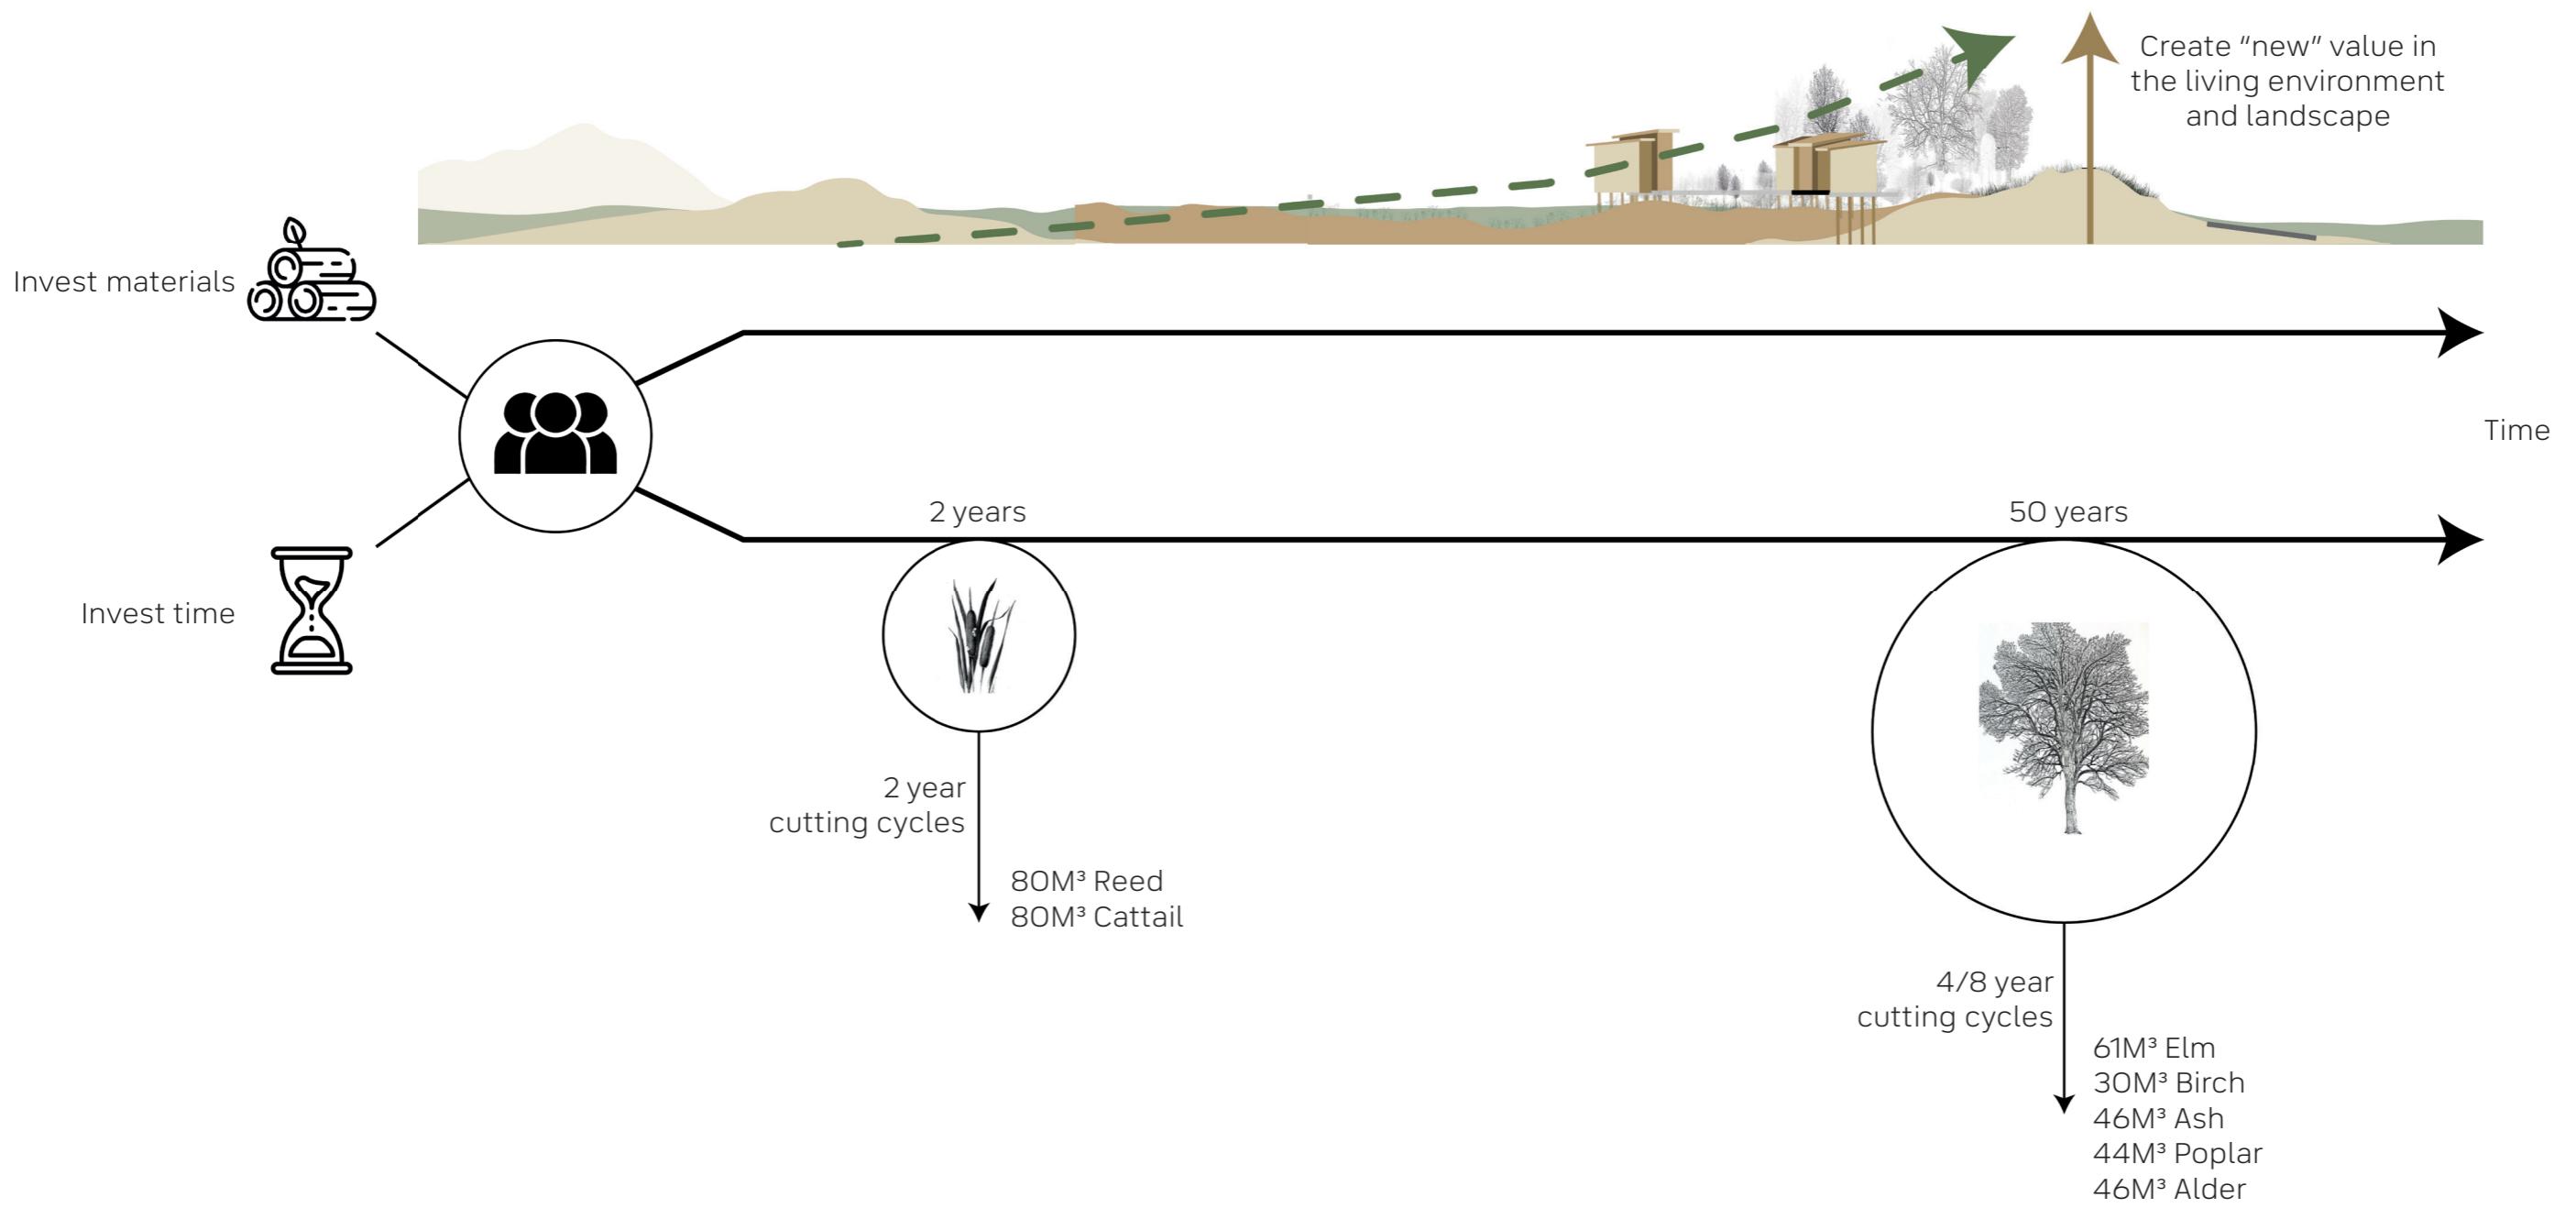

Year 7 - 8 - Plant the first trees close to each other according to the miyawaki reforesting method. To create a self sustaining forest ecosystem within 10 years.

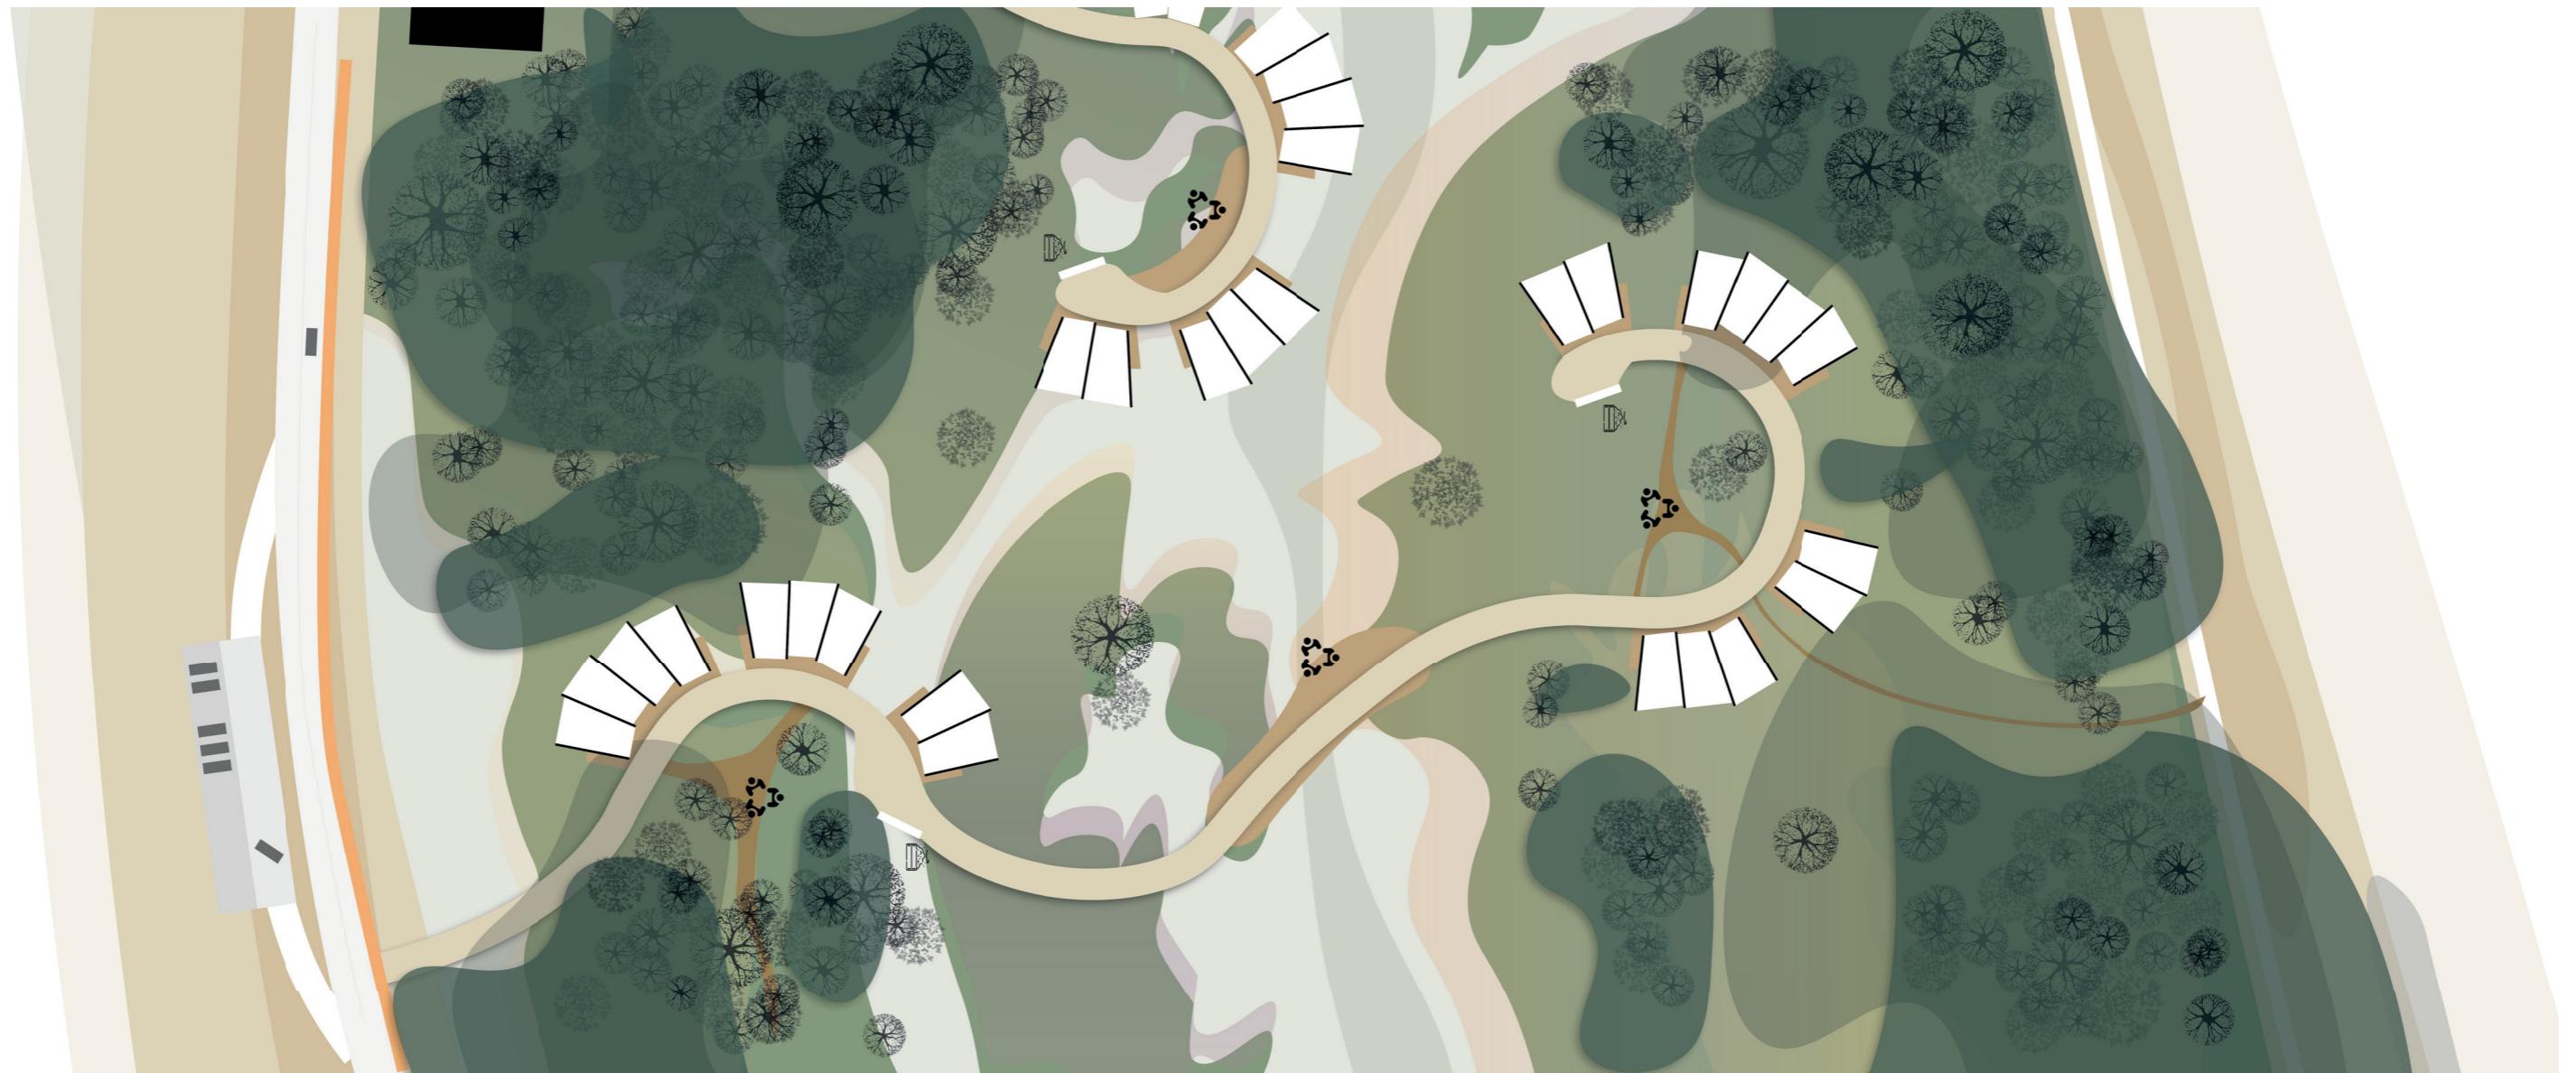

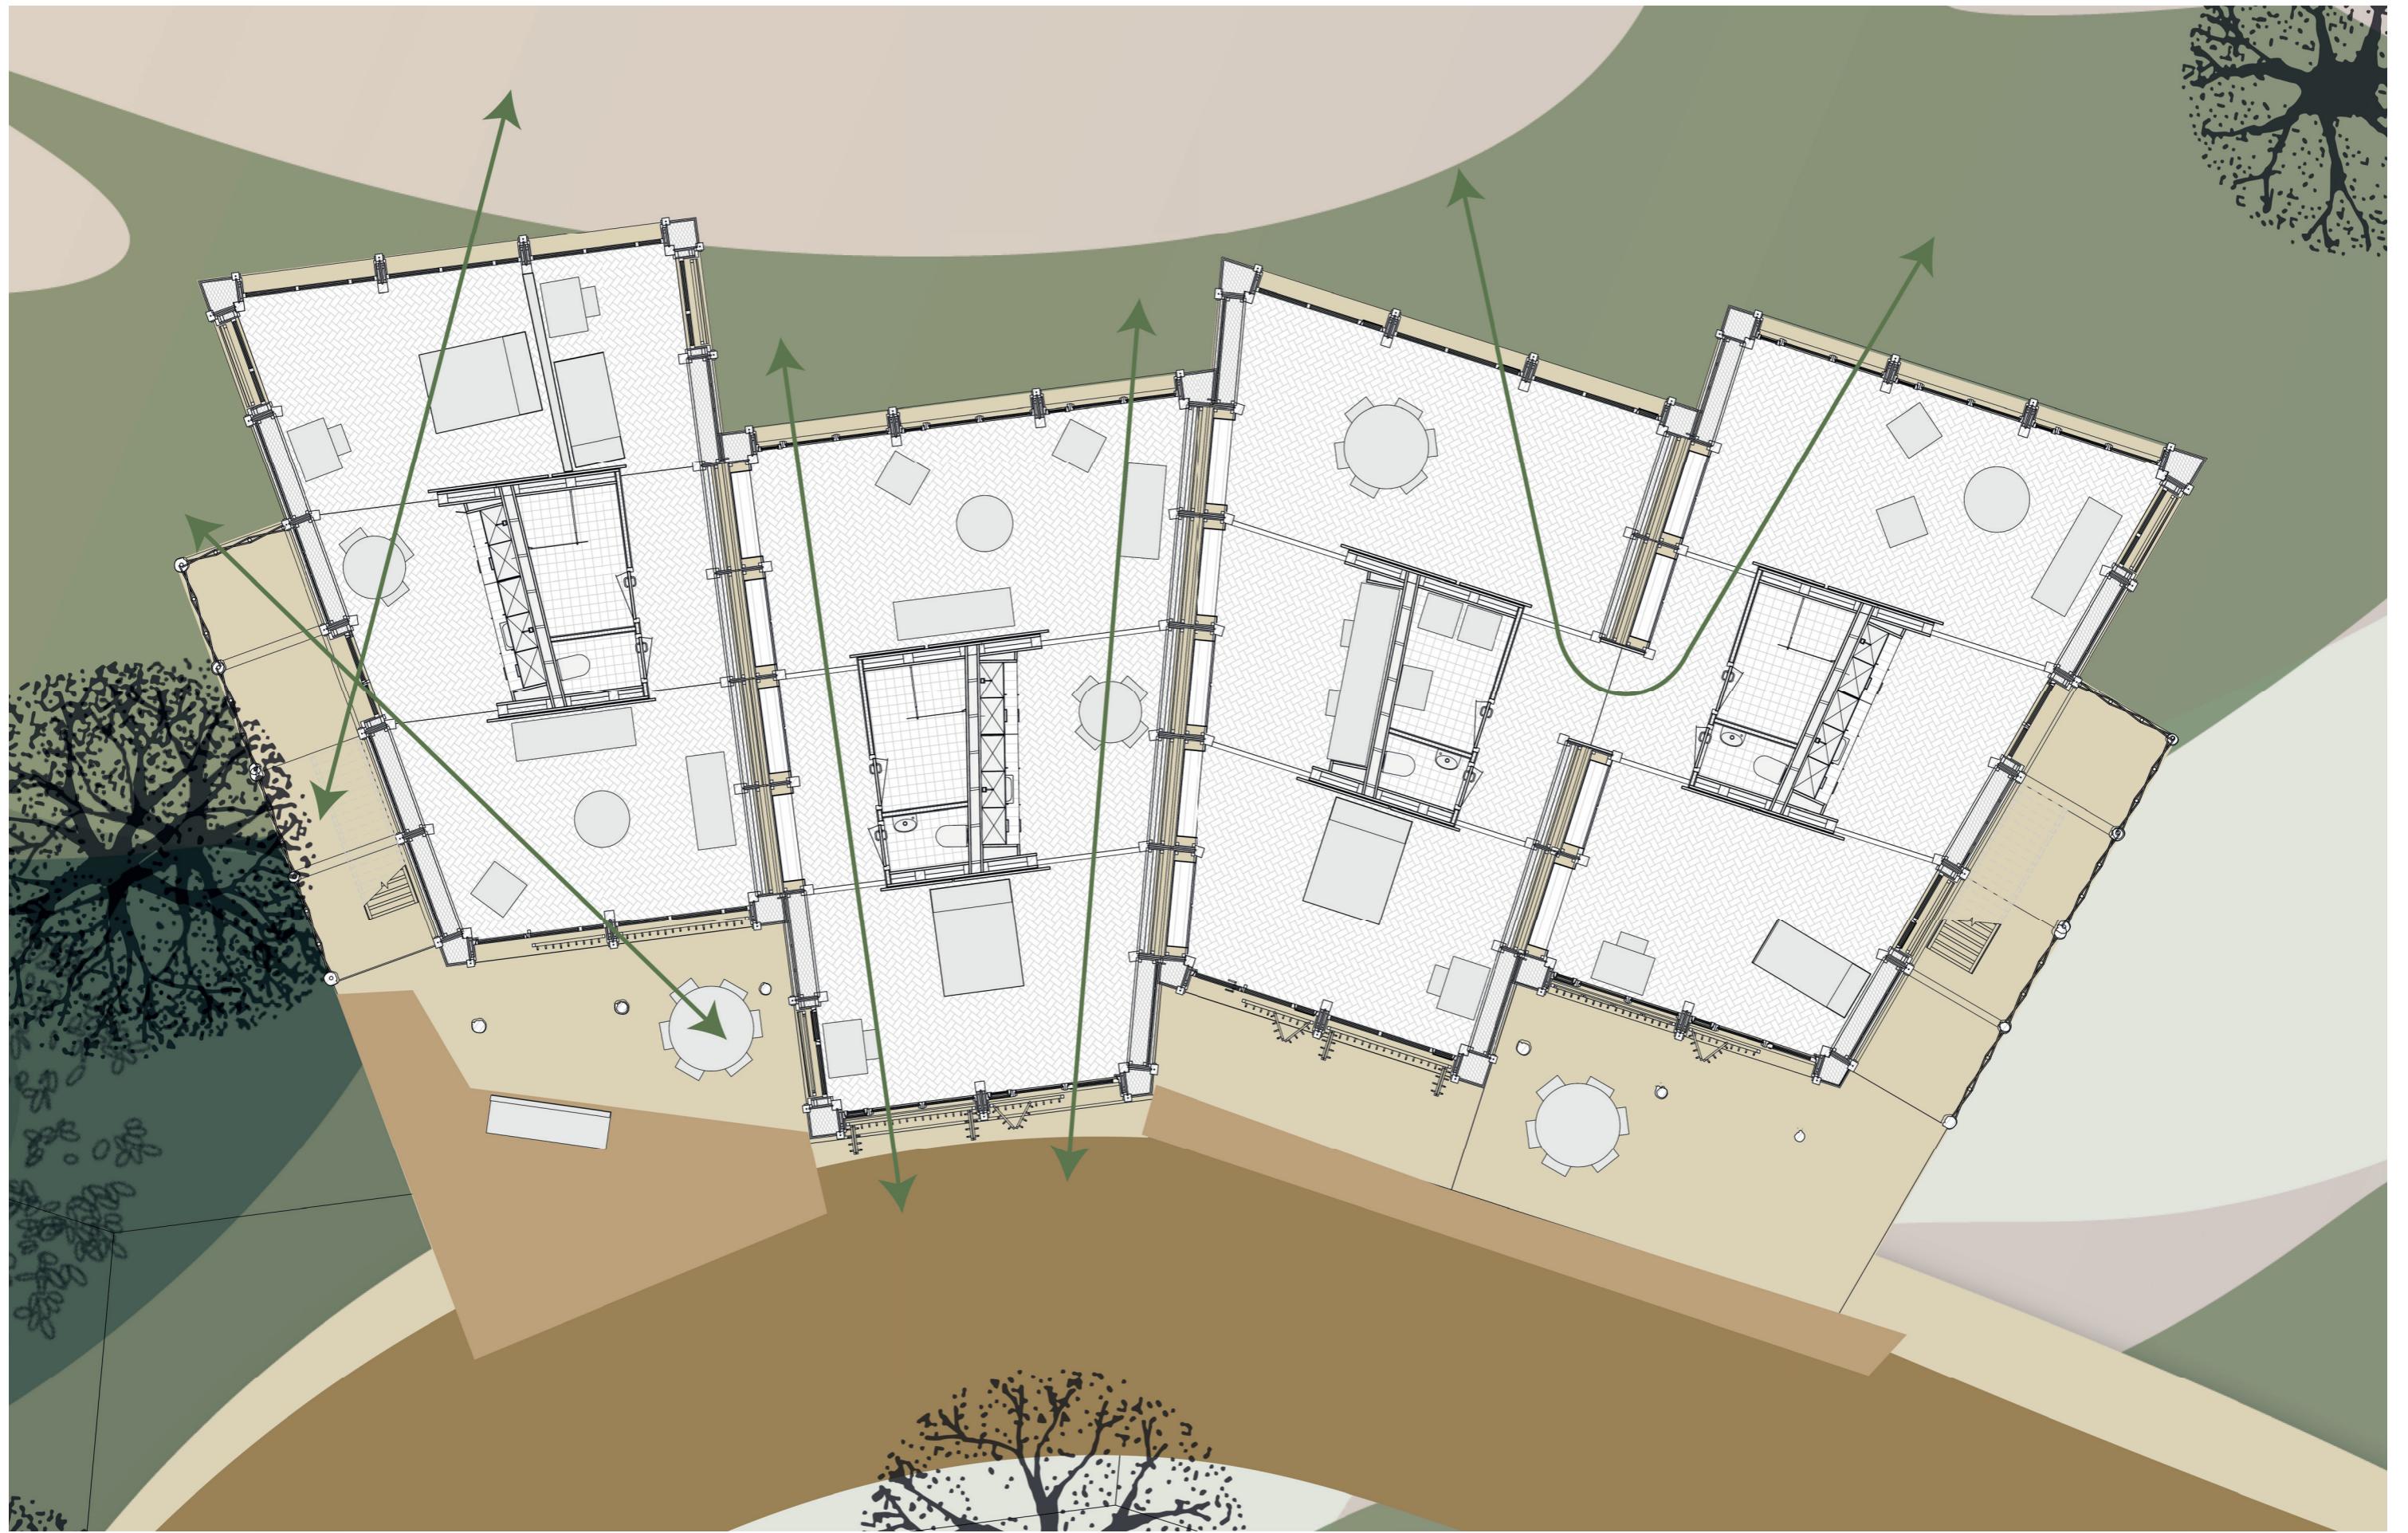

Foundation of residents and initiators

Management foundation

Foundation activity energy and mobility

3 chosen residents per street  
represent the interests of the  
whole street

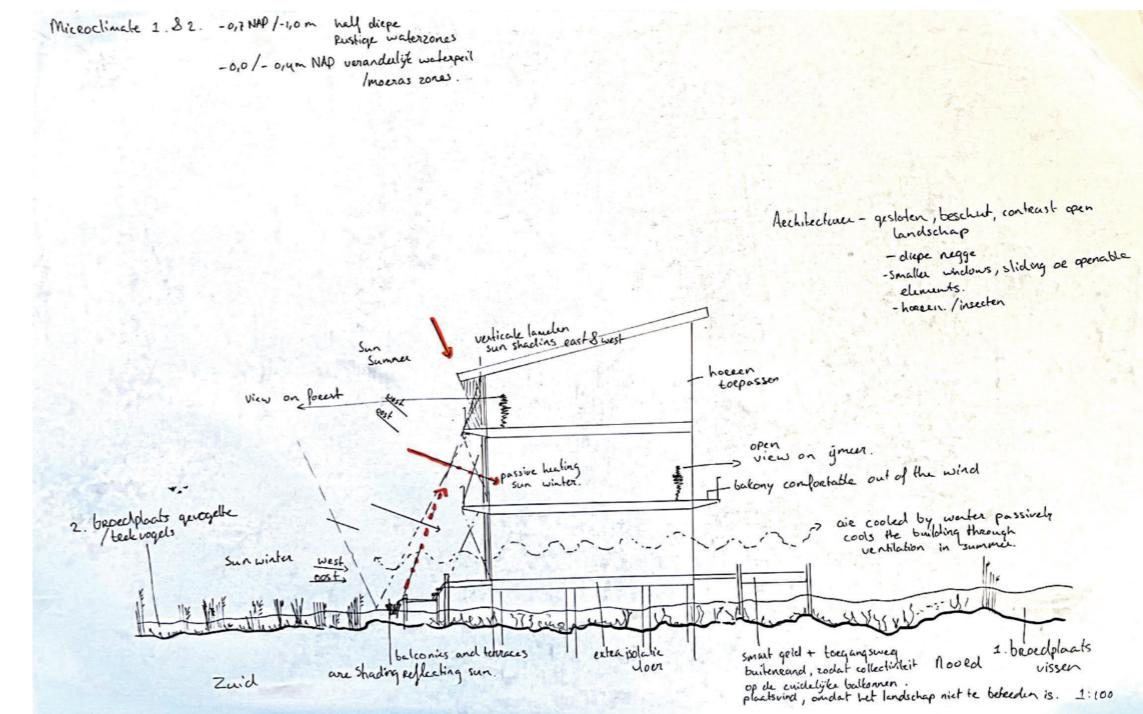

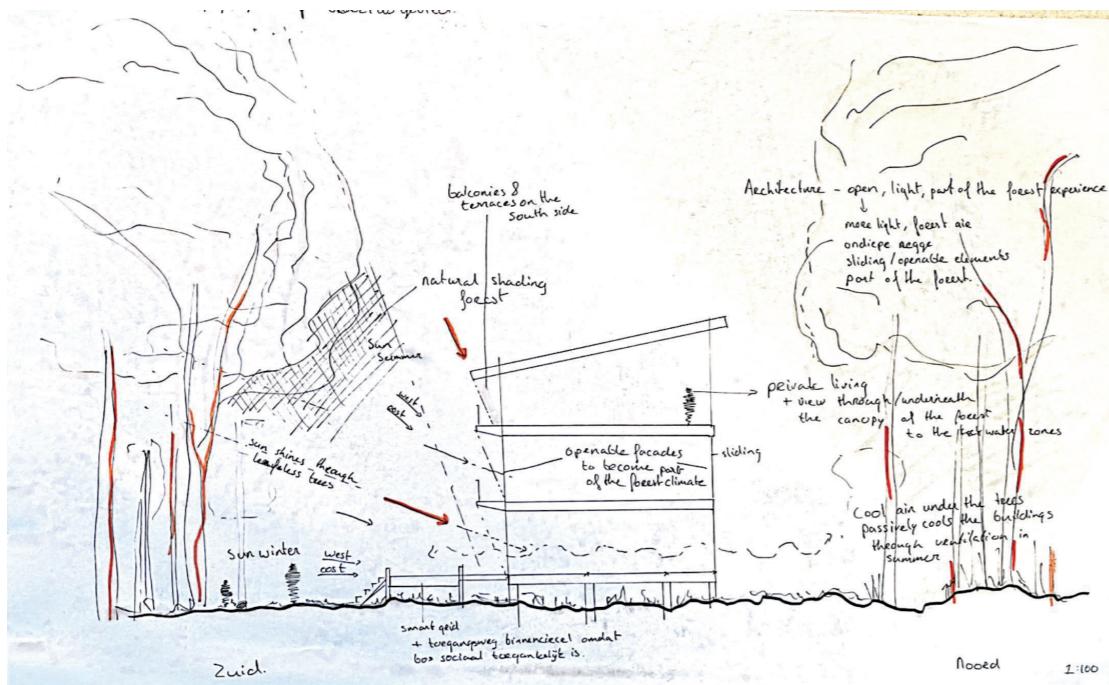

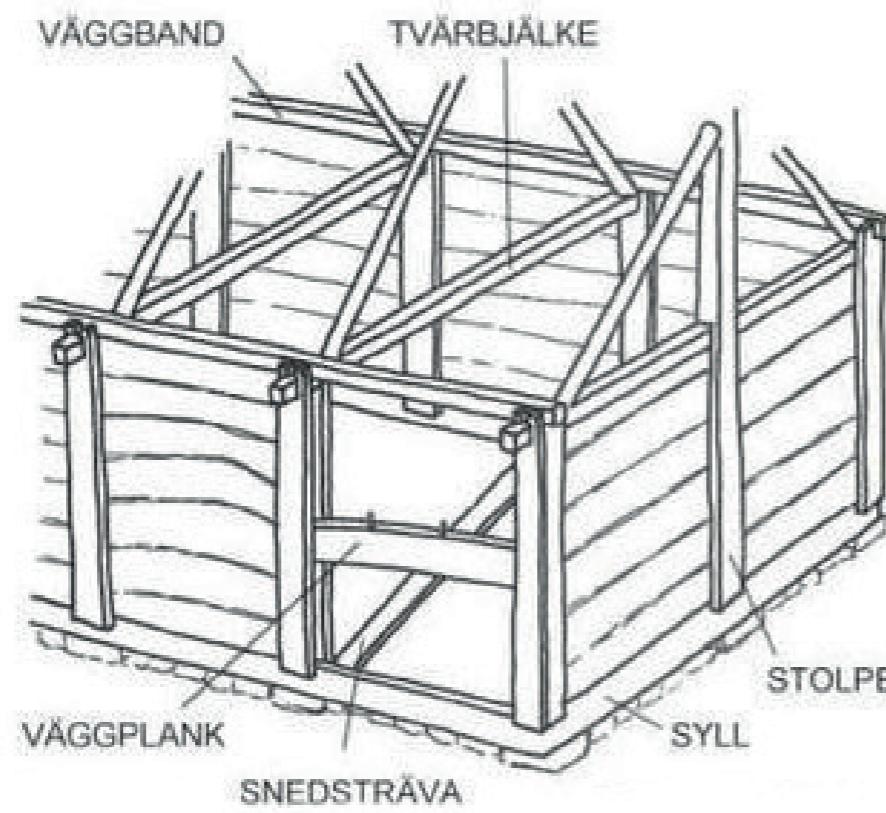

The flexibly useable rooms enable creating different spatial conditions and views

↑ N 1:100

The dancing floors create different positions and views in relation to the landscape 1:100

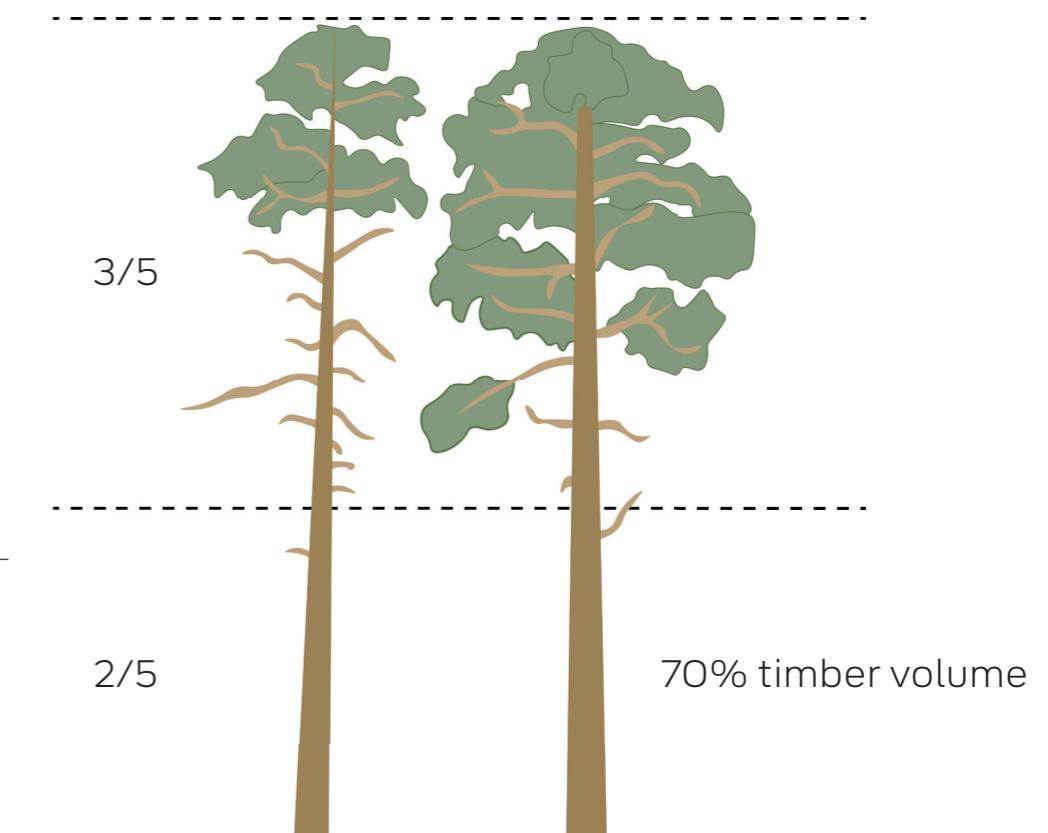

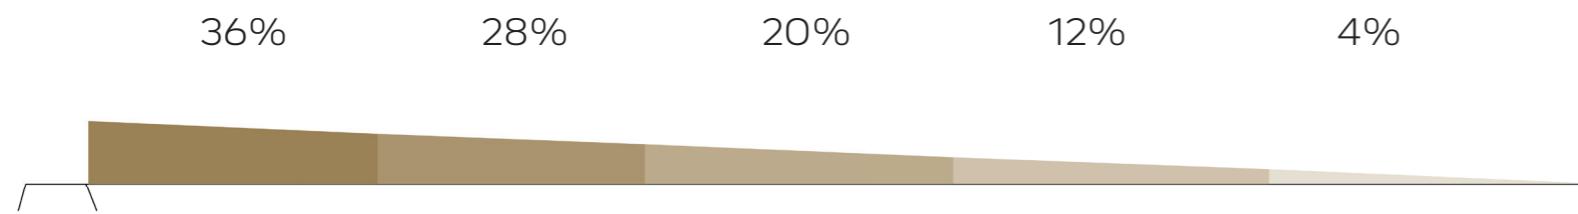

Traditional post-plank, Skiftesverk or Standerbohlenbau construction method

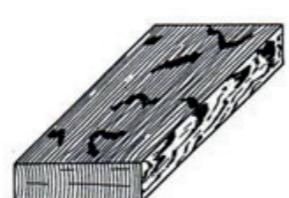

Bålehus: The farm consists of two farmhouses, the first built in 1688, the second in 1737.

*werking van half kwartiers*

# Material - Black Alder (Zwarte Els) - Alnus glutinosa

## Estimated lifespan of the timber

>100 years - keeps its quality for centuries under water

**Tree height**  
**Branch-free stem**  
**Diameter**

10-20m

6-12m

0,3-1,2m

**Tree species**  
**Type of timber**

Deciduous

Alder is soft, tough and moderately strong.

## Appearance

The trunks are almost always whole, with sparse branches that are spread assymetrical. The bark is greenisch-brown, smooth and glossy, and with age it cracks into segments. The color of the wood when cut changes from yellow to bright red.

## Colour

Dark green in colour on the upper pagina and lighter on the lower pagina.

## Application

**Processing tree into high quality durable timber**

## *Under water foundations*

1. **Watering the tree trunks for 9-12 months** makes the timber thougher and harder.

*Other reasons to water the trunks are:*

- For easier transportation
- For easier sorting
- To prevent drying cracks
- So the wood can't be affected by insects & fungi
- To rinse substances affected by insects and fungi out
- To change its structure so that the wood is easier to debark, easier to saw, dries faster and is better to impregnate

2. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.

3. Saw in desired dimensions

4. Dry the timber.

5. Impregnate with linseed oil using the drenching technique.

## Black Alder Tree specifications

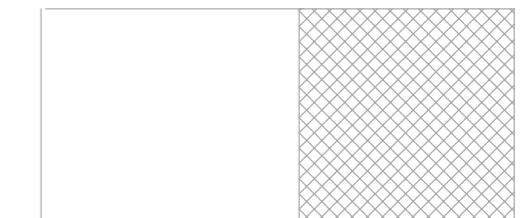

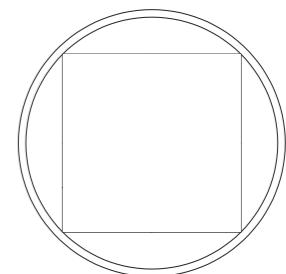

<i>Growing time</i>	50 years
<i>Height</i>	20 m
<i>Target diameter</i>	450/600 mm
<i>Max. length sawn timber</i>	12,5 m

## Architectural appearance

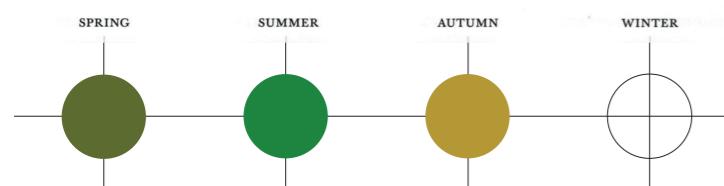

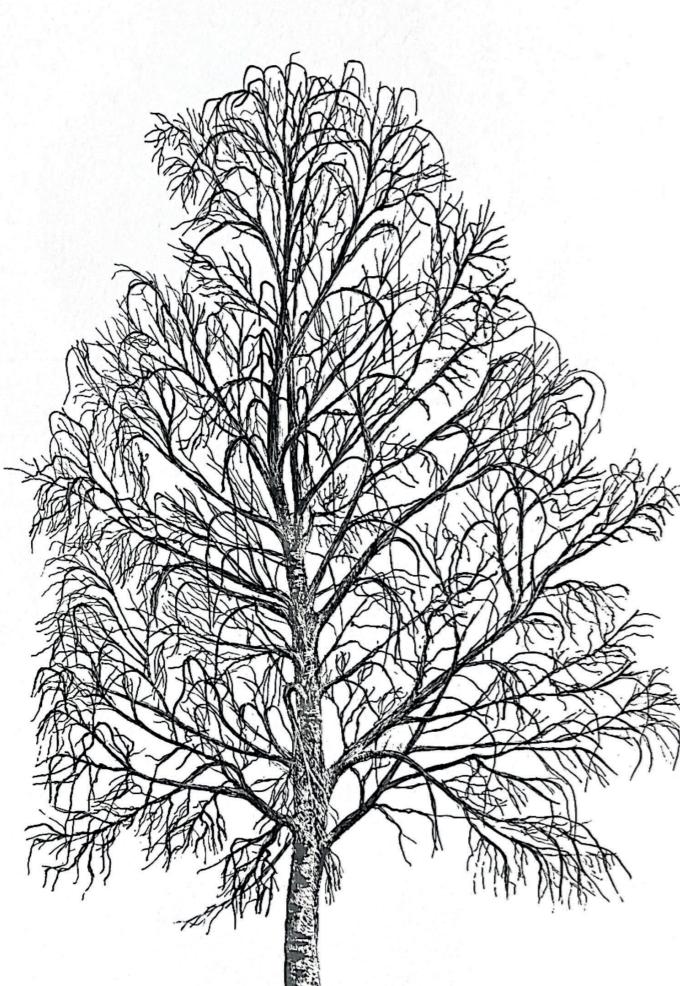

## Target diameter & Saw diagram

Length stem - 12,5m  
Target diameter - 450mm - 600mm  
Gekantrecht timber

# Material - Birch (Berk) - *Betula pendula* Roth

<b>Tree height</b>	18-21m
<b>Branch-free stem</b>	9m
<b>Diameter</b>	0,5-1,0m
<b>Tree species</b>	Deciduous
<b>Type of timber</b>	Birch is soft and can be worked well.
<b>Appearance</b>	<p>It has a erect trunk, ascendant major branches and thin secondary branches that hang downward, a sparse light crown and thin, smooth, white bark that flakes off in horizontal silver-colored strips. Birch forests are not dark and have a dense undergrowth with various grasses and shrubs.</p>
<b>Colour</b>	The upper pagina is intense green and the lower one is paler green; they turn golden yellow in autumn.
<b>Application</b>	<b>Indoor carpentry, flooring and furniture</b>
<b>Processing tree into high quality durable timber</b>	<ol style="list-style-type: none"> <li>1. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.</li> <li>2. Saw in desired dimensions</li> <li>3. Has to be relatively quickly <b>steam dried</b> since it is sensitive to blue mould.</li> <li>4. Impregnate with linseed oil using the drenching technique.</li> </ol>
<b>Estimated lifespan of the timber</b>	>50 years

## Birch Tree specifications

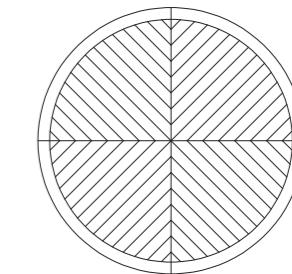

<i>Growing time</i>	>50 years
<i>Height</i>	18-21 m
<i>Target diameter</i>	450/600 mm
Max. length sawn timber 2/5 rule	7,2-8,4 m

## Architectural appearance

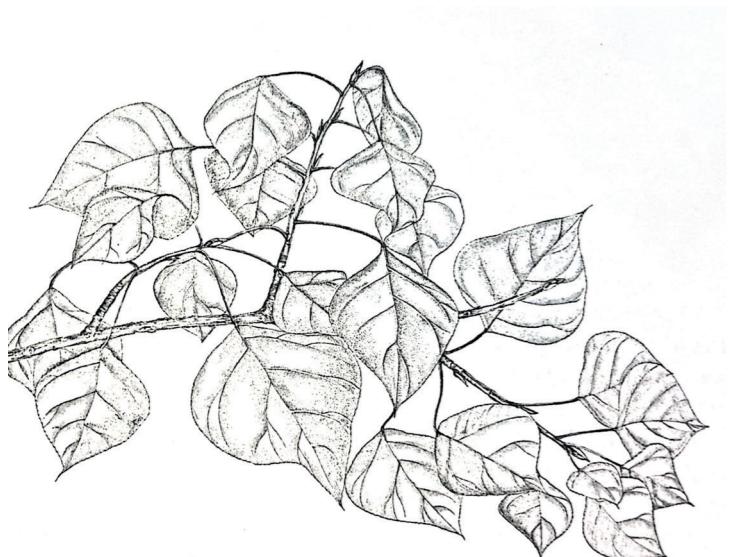

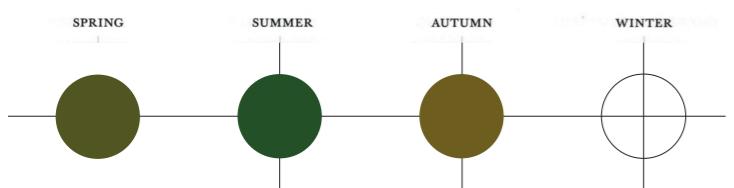

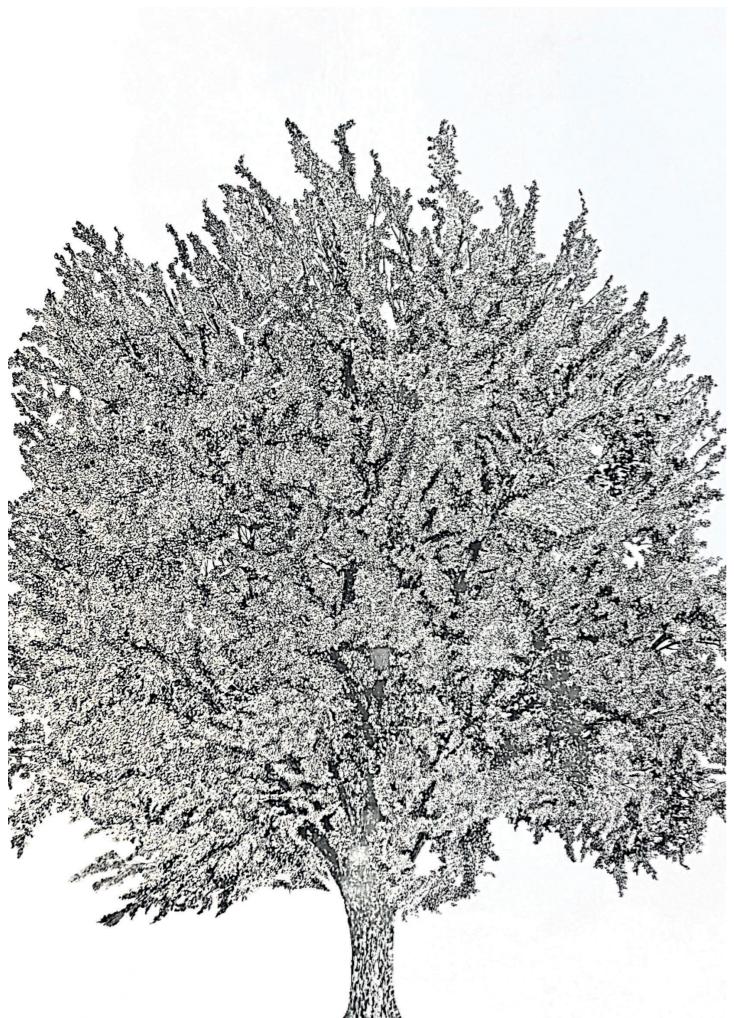

## Target diameter & Saw diagram

Length stem - 7,2 - 8,4m  
Target diameter - 450mm - 600mm  
Kwartiers timber

# Material - Black Poplar (Zwarte Populier) - *Populus nigra L.*

**Estimated lifespan of the timber**

16-25m  
0,2-0,5m

**Tree species**  
**Type of timber**

Deciduous  
Poplar is moderately strong, soft and, for its weight, tough.

**Appearance**

It has a knotty and heavily ramified trunk, a large and sparse crown, and gray-white bark that turns near-blackened and cracked and is often disfigured in old age.

**Colour**

The leaves are smooth and shiny dark green on the upper pagina, and duller with raised veins on the lower pagina.

**Application**

**Indoor carpentry, strength class C24.**

**Processing tree into high quality durable timber**

1. The tree trunks should be **watered for the minimum of one year** to improve the quality of the timber.

Other reasons to water the trunks are:

- For easier transportation
- For easier sorting
- To prevent drying cracks
- So the wood can't be affected by insects & fungi
- To rinse substances affected by insects and fungi out
- To change its structure so that the wood is easier to debark, easier to saw, dries faster and is better to impregnate

2. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.

3. Saw in desired dimensions
4. Dry the timber.
5. Impregnate with linseed oil using the drenching technique.

>50 years

## Poplar Tree specifications

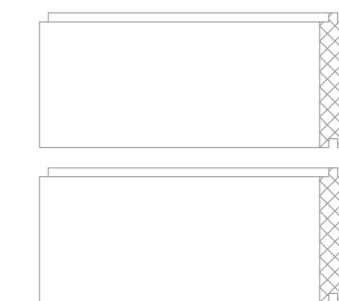

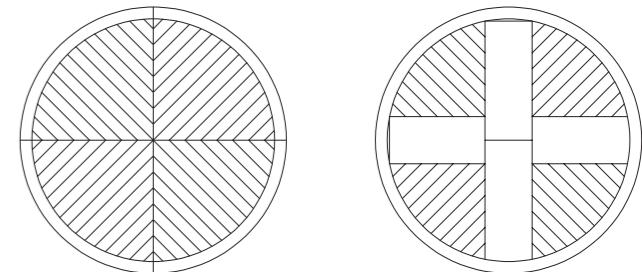

Growing time	20 years
Height	18-25 m
Target diameter	400/500 mm
Max. length sawn timber 2/5 rule	7,2-10,0 m

## Architectural appearance

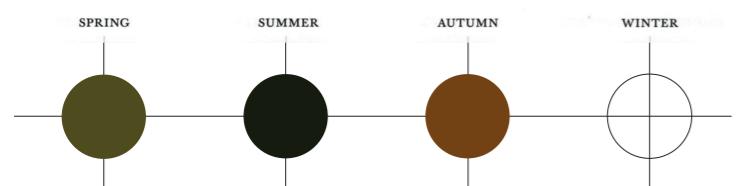

## Target diameter & Saw diagram

Length stem - 7,2 - 10m  
Target diameter - 400mm - 500mm  
Kwartiers timber

# Material - Oak (Eik) - *Quercus petraea*

<b>Tree height</b>	18-35m
<b>Branch-free stem</b>	15m
<b>Diameter</b>	1,2-1,8m
<b>Tree species</b>	Deciduous
<b>Type of timber</b>	Oak is generally hard, heavy, solid, strong and coarser in structure
<b>Appearance</b>	It has a sturdy trunk, very knotty branches, an ample crown, and bark that is smooth when young and later cracked.
<b>Colour</b>	The leaves are glossy dark green on the upper pagina and grayish on the lower one.
<b>Application</b>	<b>Exterior load bearing columns and beams</b>
<b>Processing tree into high quality durable timber</b>	<p>1. The tree trunks should be <b>watered for 3 to 4 years</b> to improve the quality of the timber.</p> <p>Other reasons to water the trunks are:</p> <ul style="list-style-type: none"> <li>- For easier transportation</li> <li>- For easier sorting</li> <li>- To prevent drying cracks</li> <li>- So the wood can't be affected by insects &amp; fungi</li> <li>- To rinse substances affected by insects and fungi out</li> <li>- To change its structure so that the wood is easier to debark, easier to saw, dries faster and is better to impregnate</li> </ul> <p>2. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.</p> <p>3. Saw in desired dimensions &amp; de-core the beams and columns.</p> <p>4. Dry the timber.</p> <p>5. Impregnate with linseed oil using the drenching technique.</p>

**Estimated lifespan of the timber**

>100 years

## Oak Tree specifications

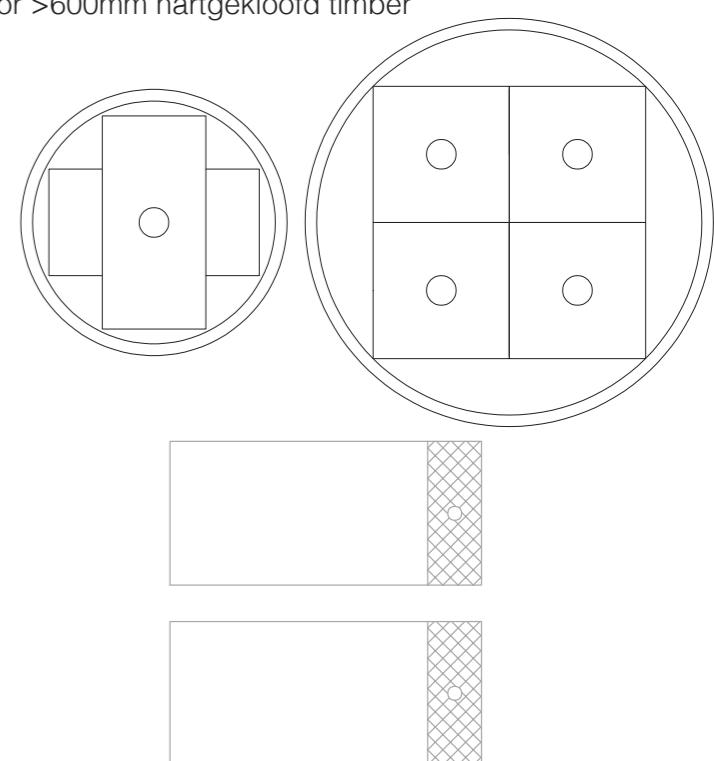

<i>Growing time</i>	80-120 years
<i>Height</i>	18-30 m
<i>Target diameter</i>	600/700 mm
Max. length sawn timber 2/5 rule	7,2-12 m

## Architectural appearance

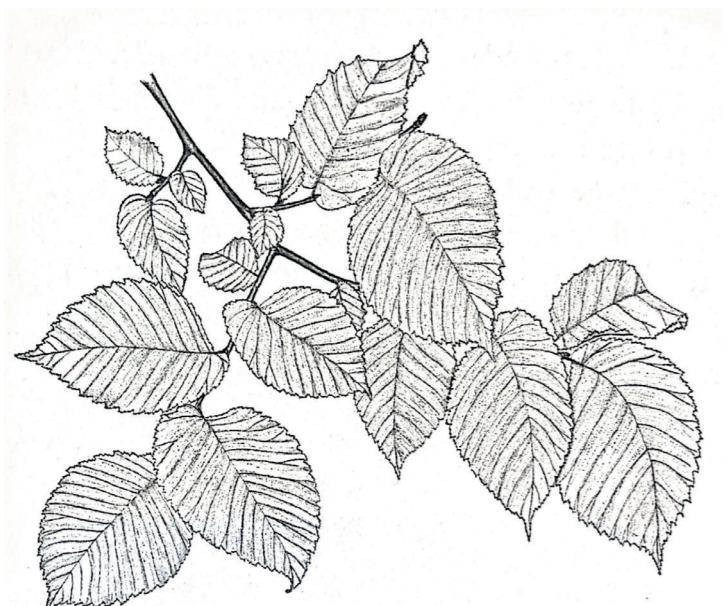

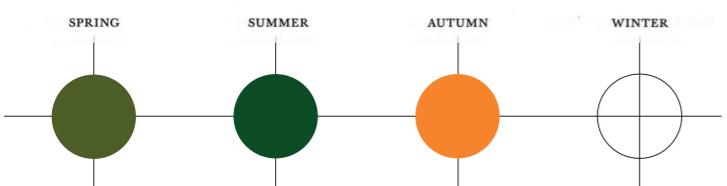

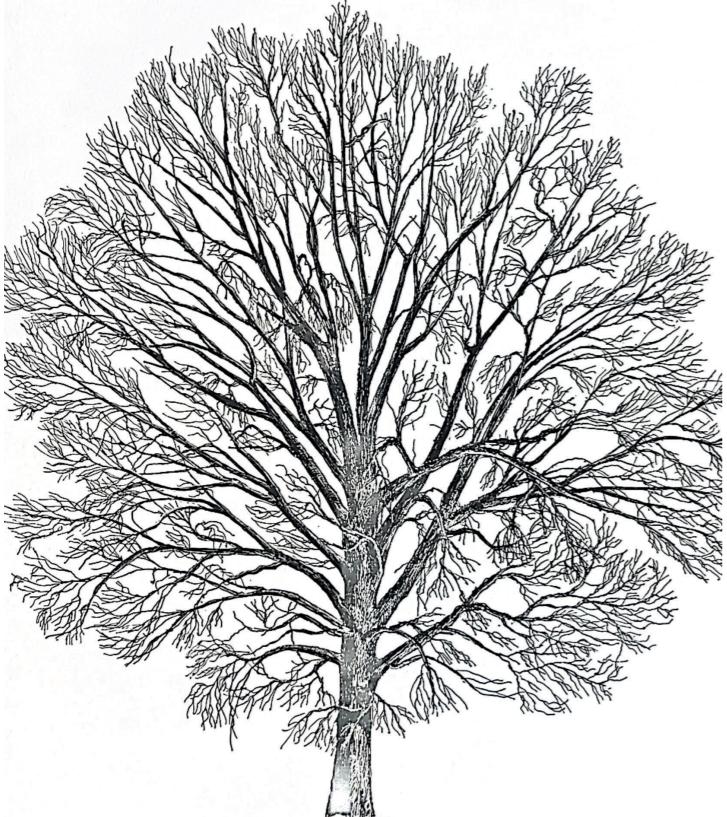

## Target diameter & Saw diagram

Length stem - 7,2 - 12m  
Target diameter - 450mm - 700mm  
450mm gekantrecht timber & de-cored,  
or >600mm hartgekloofd timber

# Material - Elm (lep) - *Ulmus glabra*

**Tree height**  
**Branch-free stem**  
**Diameter**

25m  
10-18m  
0,9-1,4m

**Tree species**  
**Type of timber**

Deciduous  
Elm wood is solid, tough, fairly light and usually uniform in structure.

**Appearance**

It has an erect trunk with many branches, an ample and dense crown, and bark that is smooth when young, then cracked.

**Colour**

The leaves are dark green and rough on the upper pagina and lighter coloured and hairy on the lower one, and with a substantial number of veins.

**Application**

**Facade cladding & decking planks.**

**Processing tree into high quality durable timber**

1. The tree trunks should be **watered for 2 to 4 years** to improve the durability, the hardness, strength, skid resistance and weather resistance.

*Other reasons to water the trunks are:*

- For easier transportation
- For easier sorting
- To prevent drying cracks
- So the wood can't be affected by insects & fungi
- To rinse substances affected by insects and fungi out
- To change its structure so that the wood is easier to debark, easier to saw, dries faster and is better to impregnate

2. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.

3. Saw in desired dimensions.

4. Dry the timber.

5. Impregnate with linseed oil using the drenching technique.

80-100 years

## Elm Tree specifications

<i>Growing time</i>	50 years
<i>Height</i>	25 m
<i>Target diameter</i>	450/600 mm

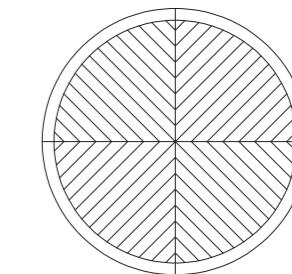

<i>Max. length sawn timber</i>	10 m
<i>2/5 rule</i>	

## Architectural appearance

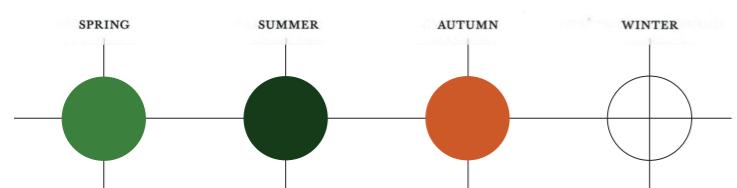

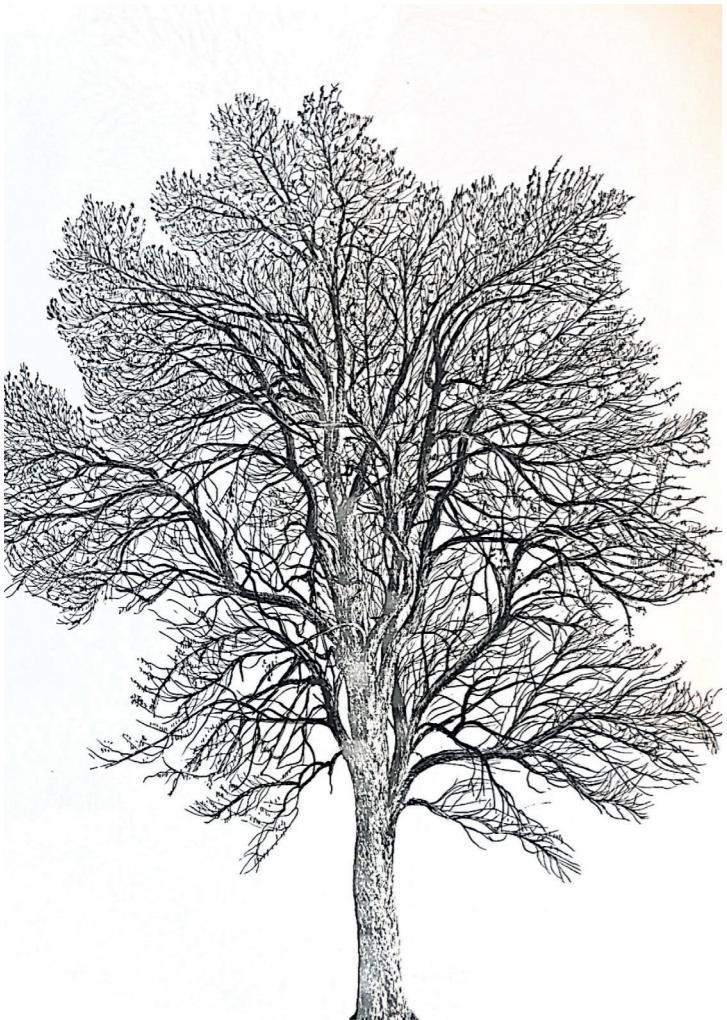

## Target diameter & Saw diagram

Length stem - 10m  
Target diameter - 450mm - 600mm  
Kwartiers timber

# Material - Ash (Es) - *Fraxinus excelsior*

**Tree height**  
**Branch-free stem**  
**Diameter**

30m  
15-20m  
0,4-0,9m

**Tree species**  
**Type of timber**

Deciduous  
Ash is tough, strong, hard and heavy.

**Appearance**

It has a straight, slender, sparsely ramified trunk, and a round crown that is more dense when it grows in isolation. The trunk's bark is smooth and olive coloured when young, and then turns brown and cracks longitudinally.

**Colour**

The upper pagina is glabrous, while the lower pagina is lighter in colour and hairy.

**Application**

**Interior loadbearing columns and beams, strength class D40. & window frames**

**Processing tree into high quality durable timber**

1. Debark the tree, so the wood has less discolouration, the sap wood hardens faster and is less affected by insects.
2. Saw in desired dimensions
3. Ash can be air-dried quite easily, ensuring that water does not collect in hollowed sheets (heart side up). To preserve the clear colour, ash should not be artificially dried at too high temperatures (max. 60°C).
4. Impregnate with linseed oil using the drenching technique.

**Estimated lifespan of the timber**

>100 years

## Es Tree specifications

<i>Growing time</i>	50 years
<i>Height</i>	30 m
<i>Target diameter</i>	450/600 mm

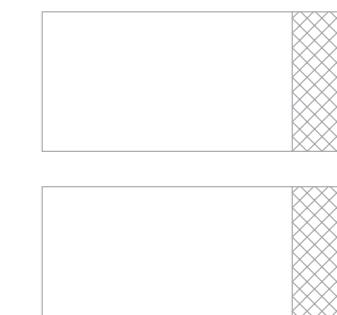

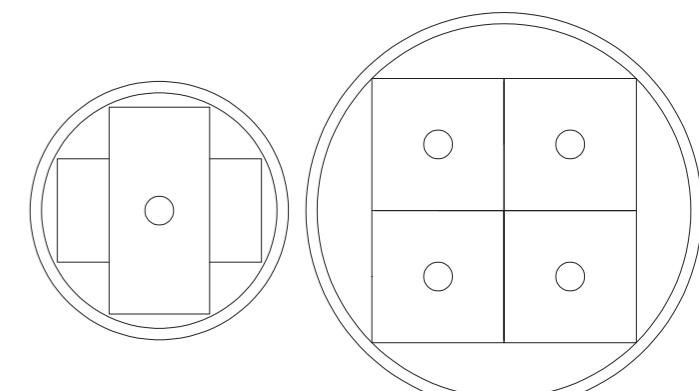

<i>Max. length sawn timber</i>	12 m
<i>2/5 rule</i>	

## Architectural appearance

## Target diameter & Saw diagram

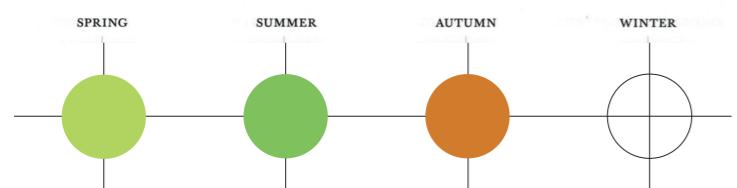

Length stem - 12m  
Target diameter - 450mm - 600mm  
450mm gekantrecht timber & de-cored,  
or >600mm hartgekloofd timber

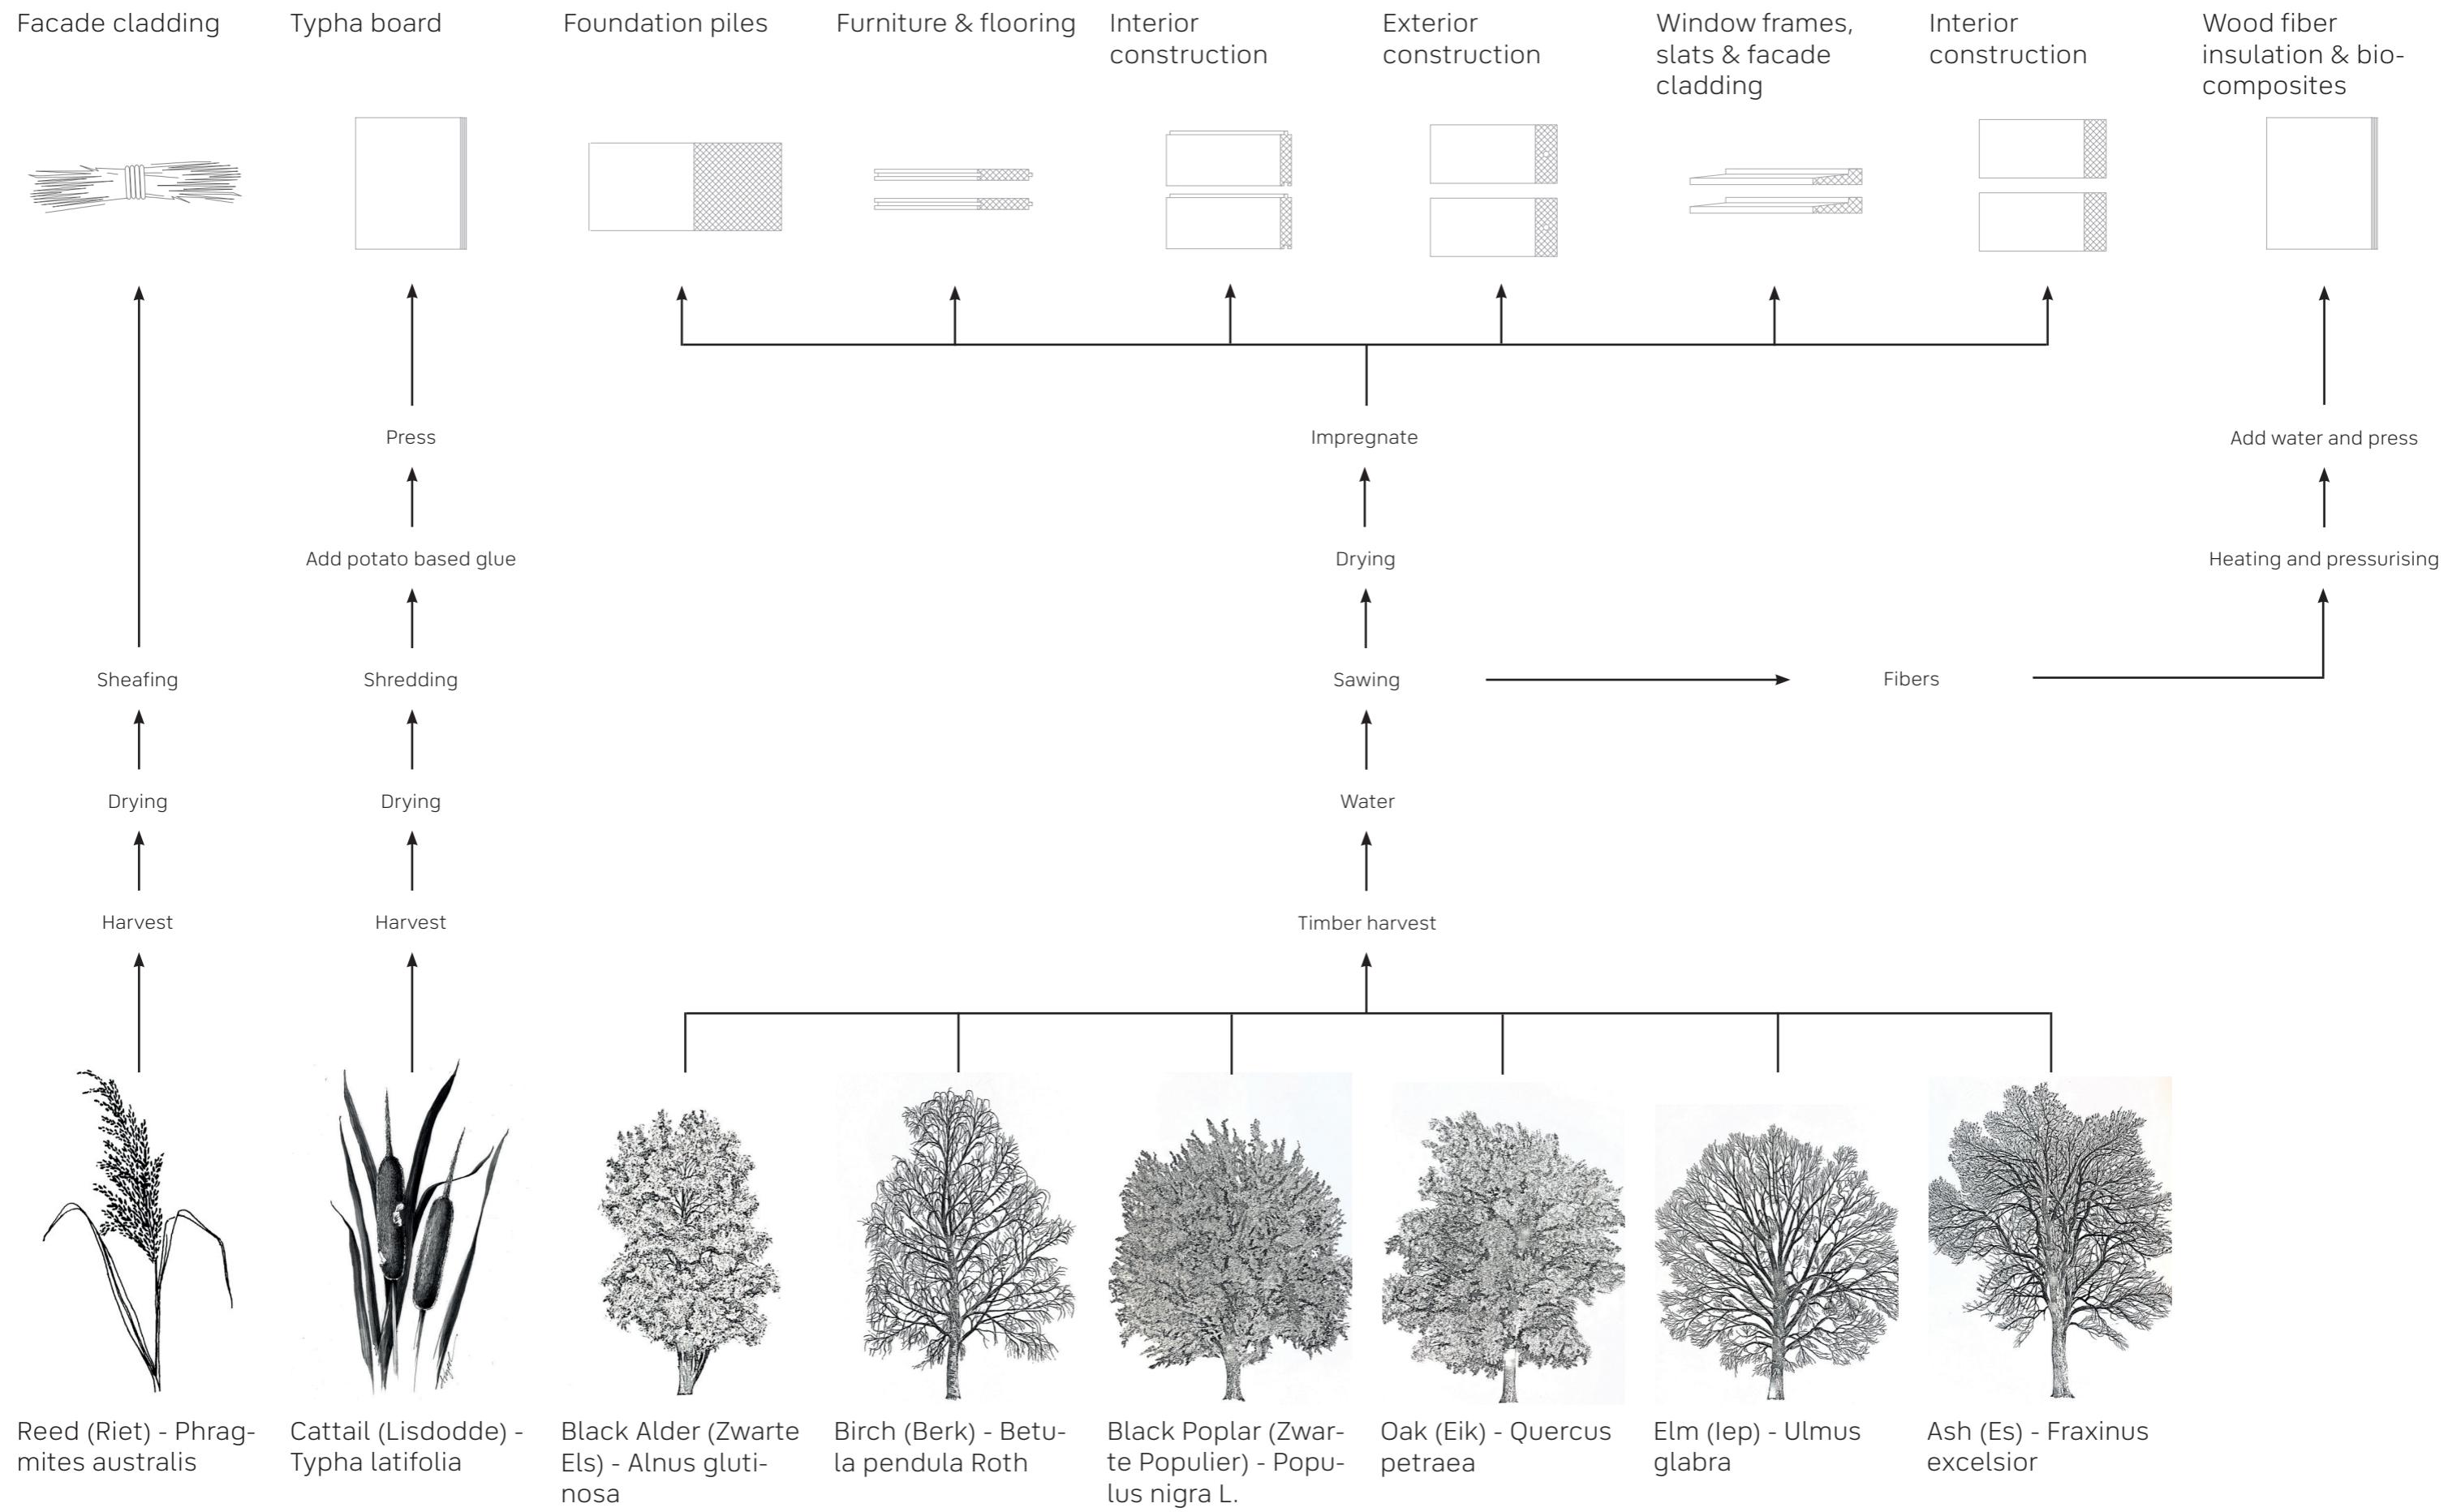

## Material - Willow (Wilg) - *Salix alba L.*

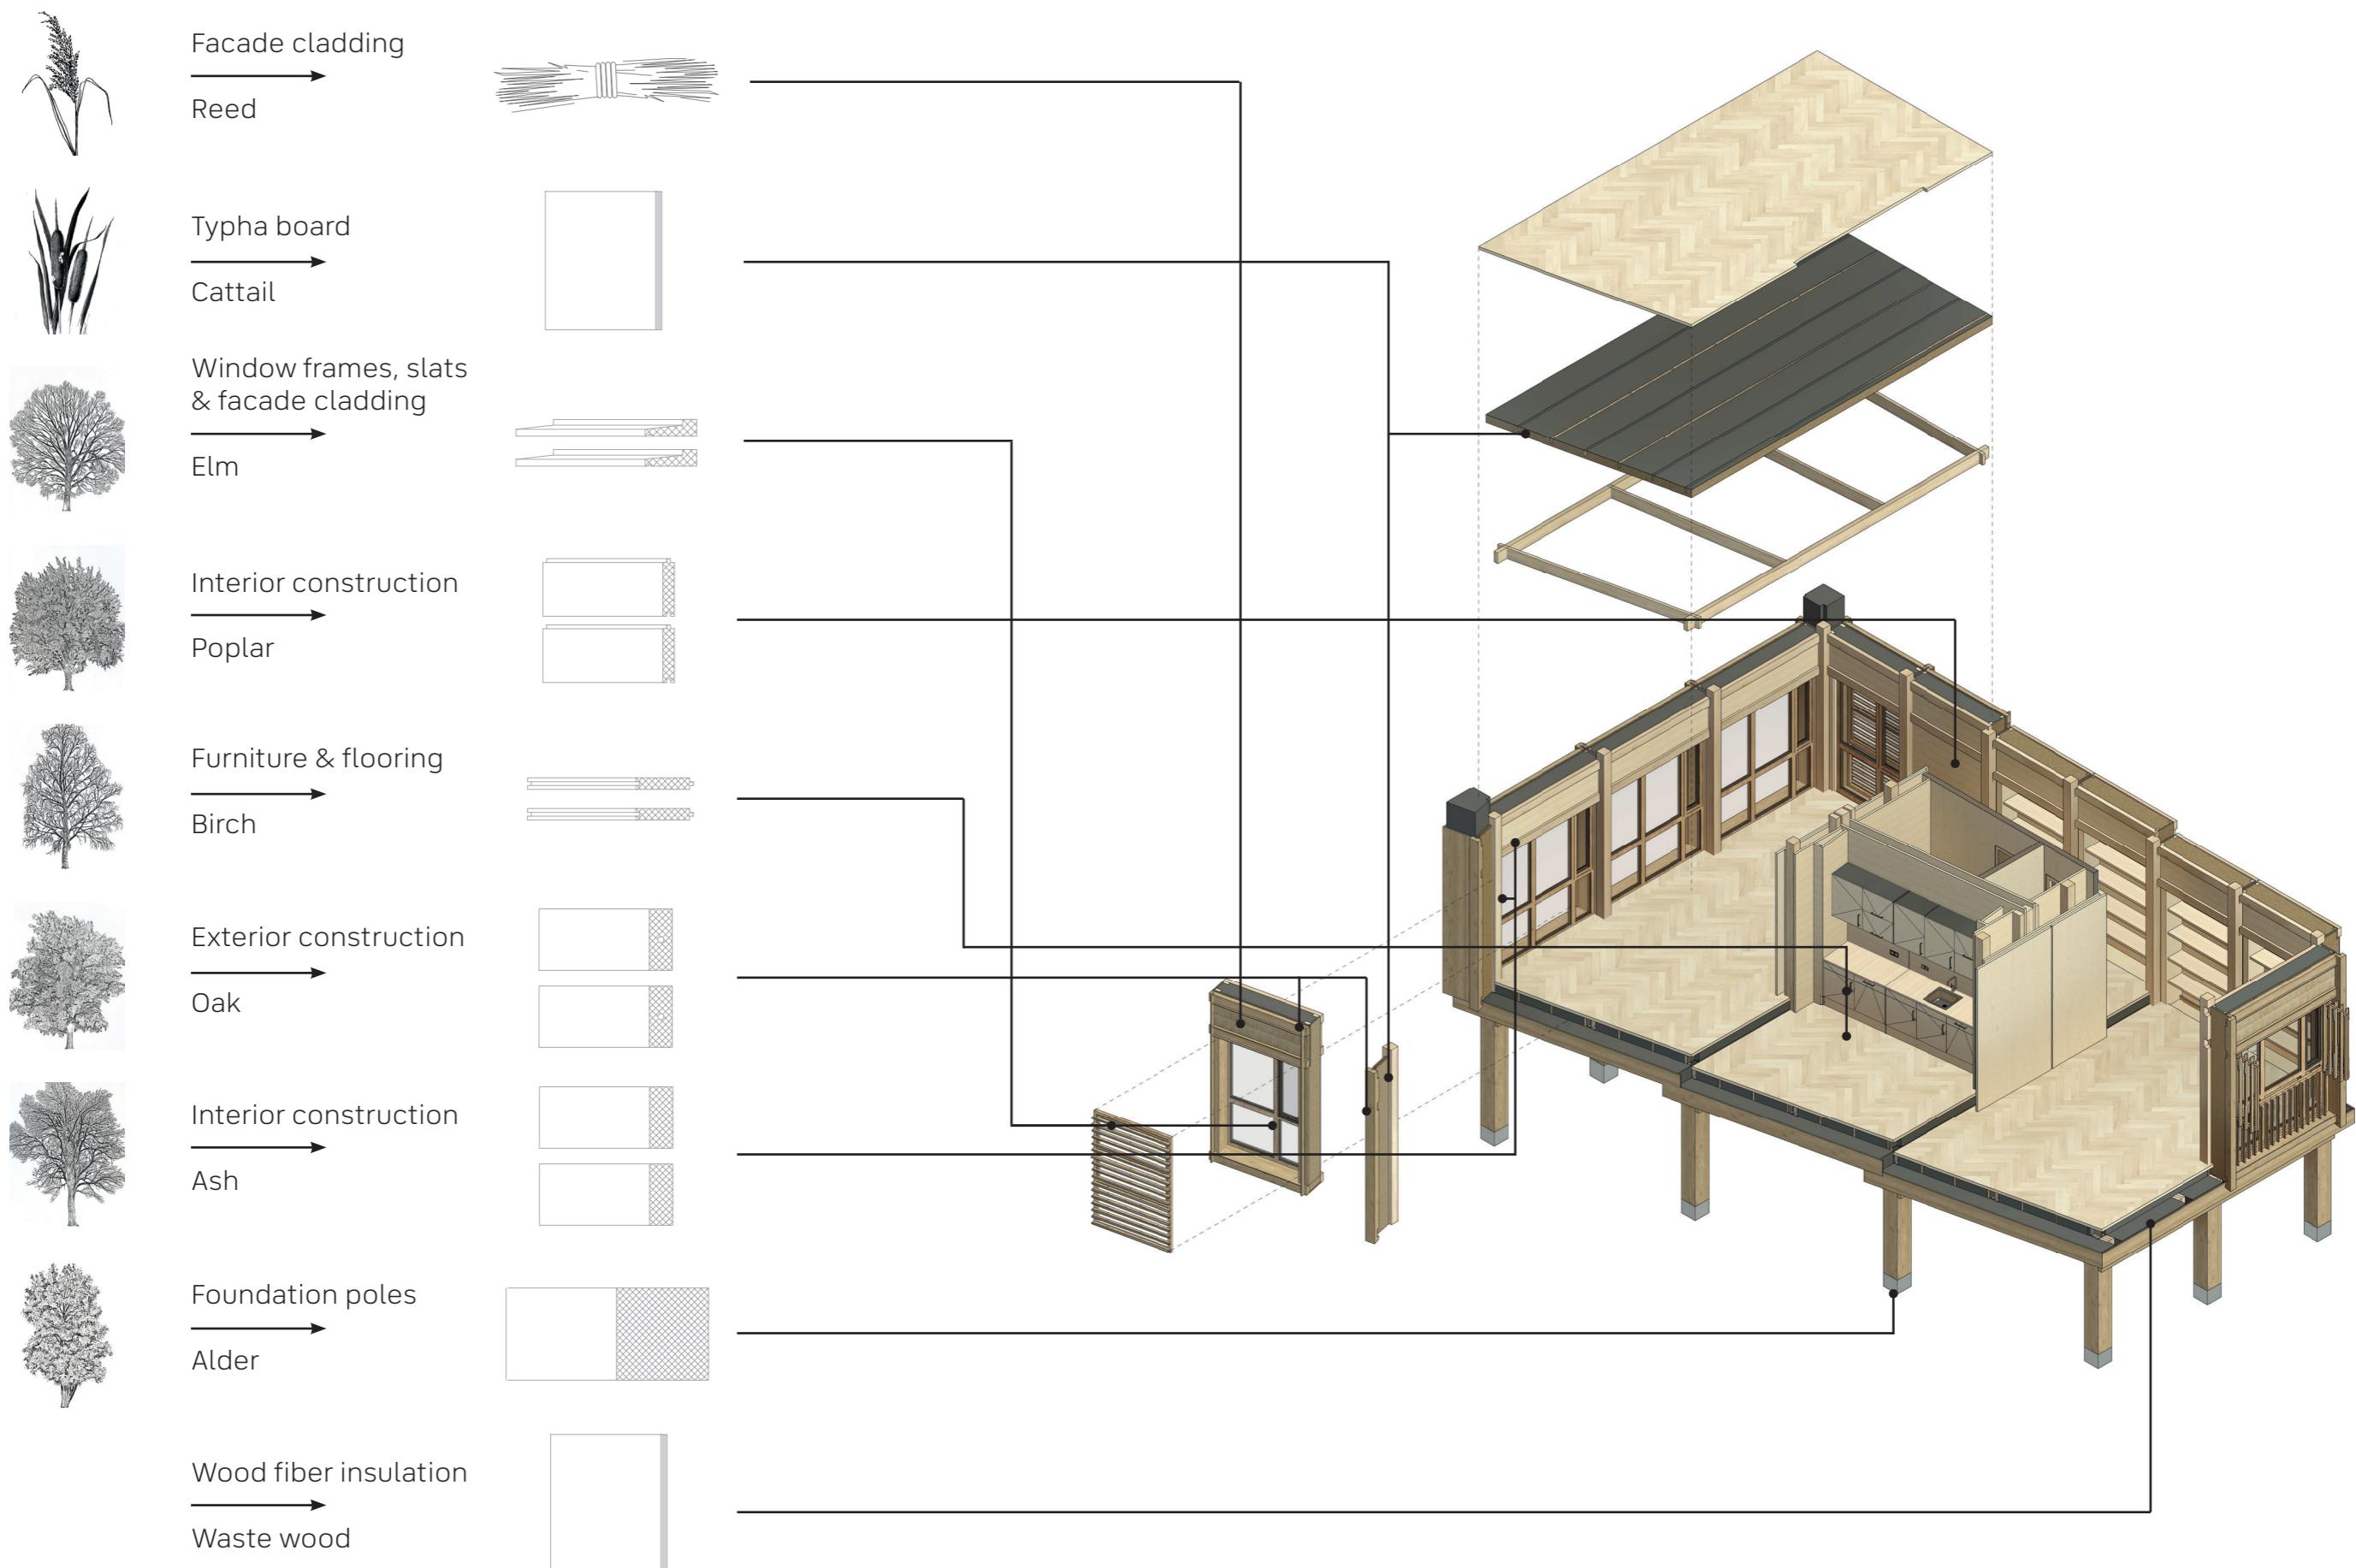

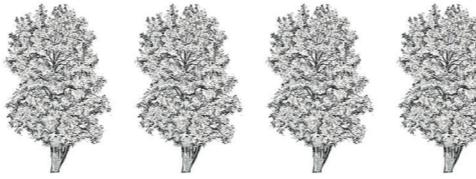

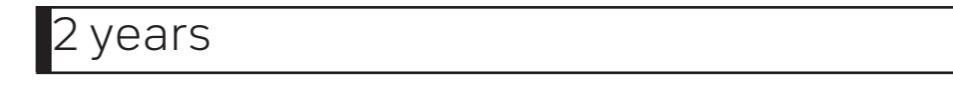

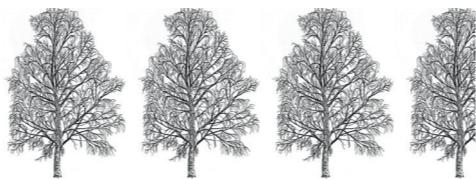

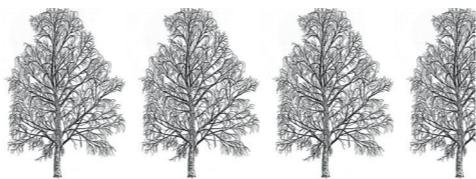

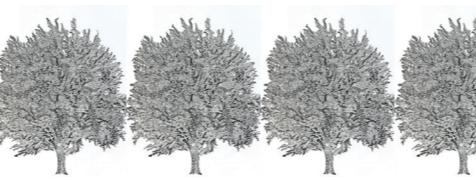

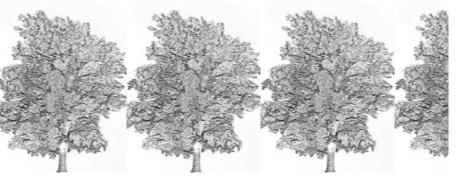

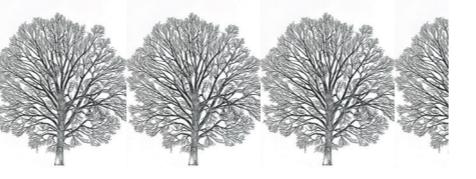

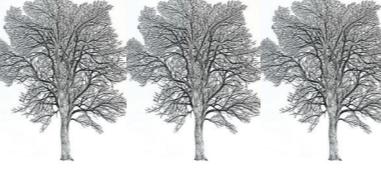

<b>Tree height</b>	21-27m
<b>Branch-free stem</b>	5-8m, often knotted at 2-2,5m
<b>Diameter</b>	0,9-1,2m
<b>Tree species</b>	Deciduous
<b>Type of timber</b>	Willow is moderately strong, soft and, for its weight, tough.
<b>Appearance</b>	It has a straight trunk, ascending and ramified branches, a large grey crown, and bark that is smooth when young, then cracked.
<b>Colour</b>	The leaves are shiny green on the upper pagina and silver on the lower pagina due to their characteristic sericeous hairs.
<b>Application</b>	Woven willow (wilgentenen) fencing, sun blinds and slats
<b>Processing</b>	<ol style="list-style-type: none"><li>1. Knot the tree trunk at 2-2,5m.</li><li>2. Cut the twigs in the desired lengths.</li><li>3. Dry the willow twigs.</li><li>4. Impregnate the twigs with linseed oil using the drenching technique.</li><li>5. Weave the willow twigs.</li></ol>
<b>Estimated lifespan of the willow twigs</b>	>30 years

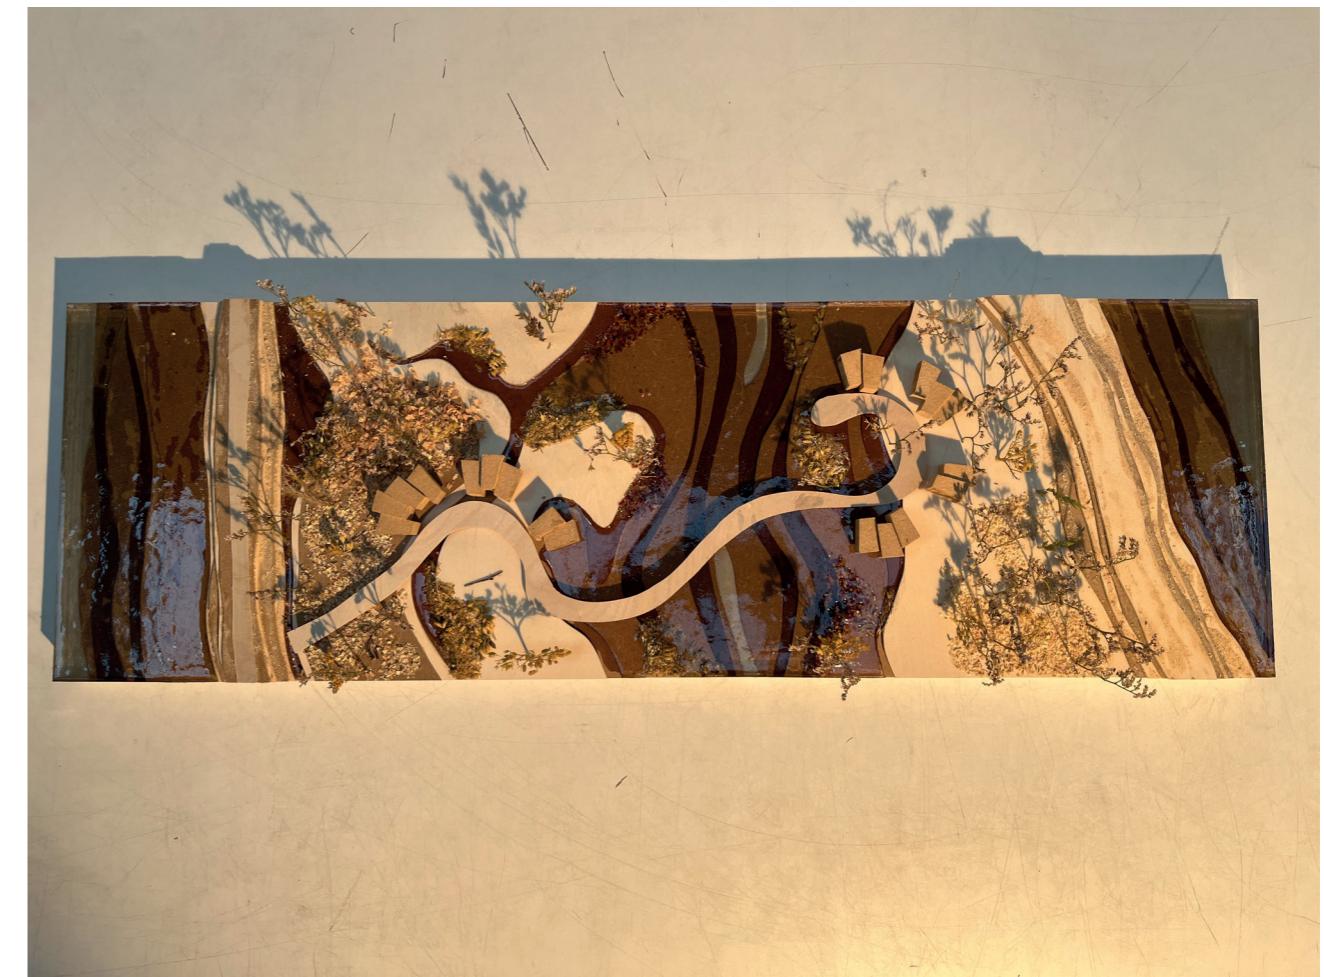

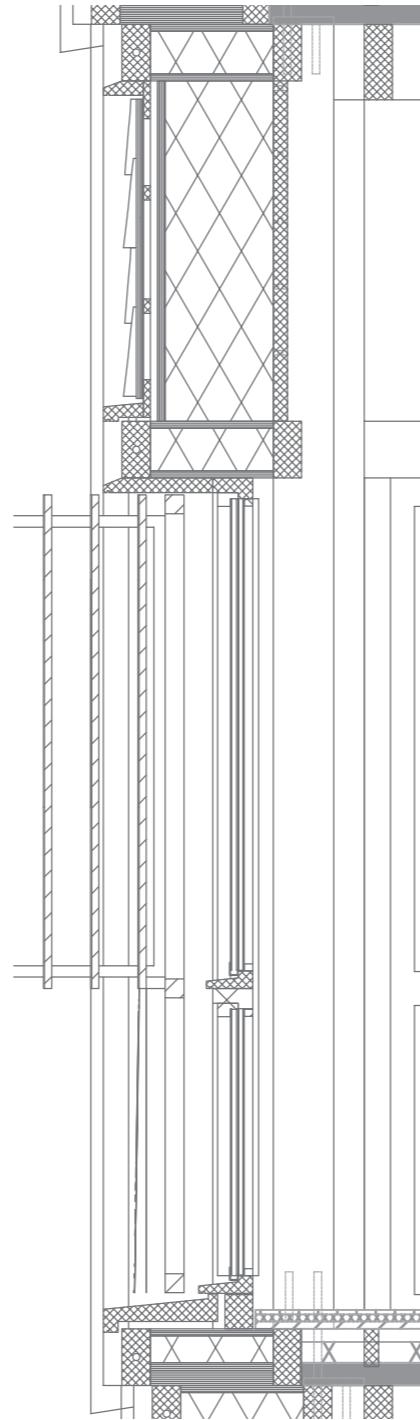

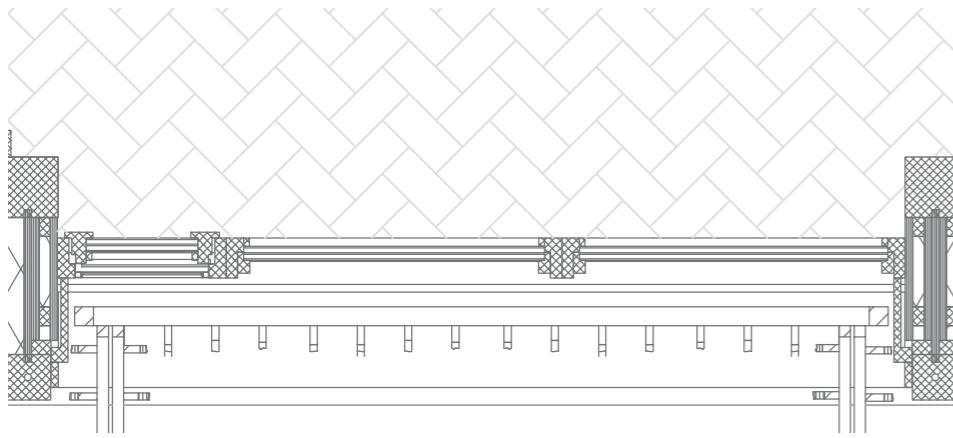

Material necessary for one 60m <sup>2</sup> dwelling	M <sup>3</sup> material needed excluding sawing loss	Amount of trees needed including sawing loss (50%)	Growing time
 Facade cladding Reed	4,6M <sup>3</sup>		2 years
 Typha board Cattail	9,9M <sup>3</sup>		2 years

ARCHITECTURAL ENGINEERING RUBEN KOPPES

FREEDOM IN INFILL AND USE - 59

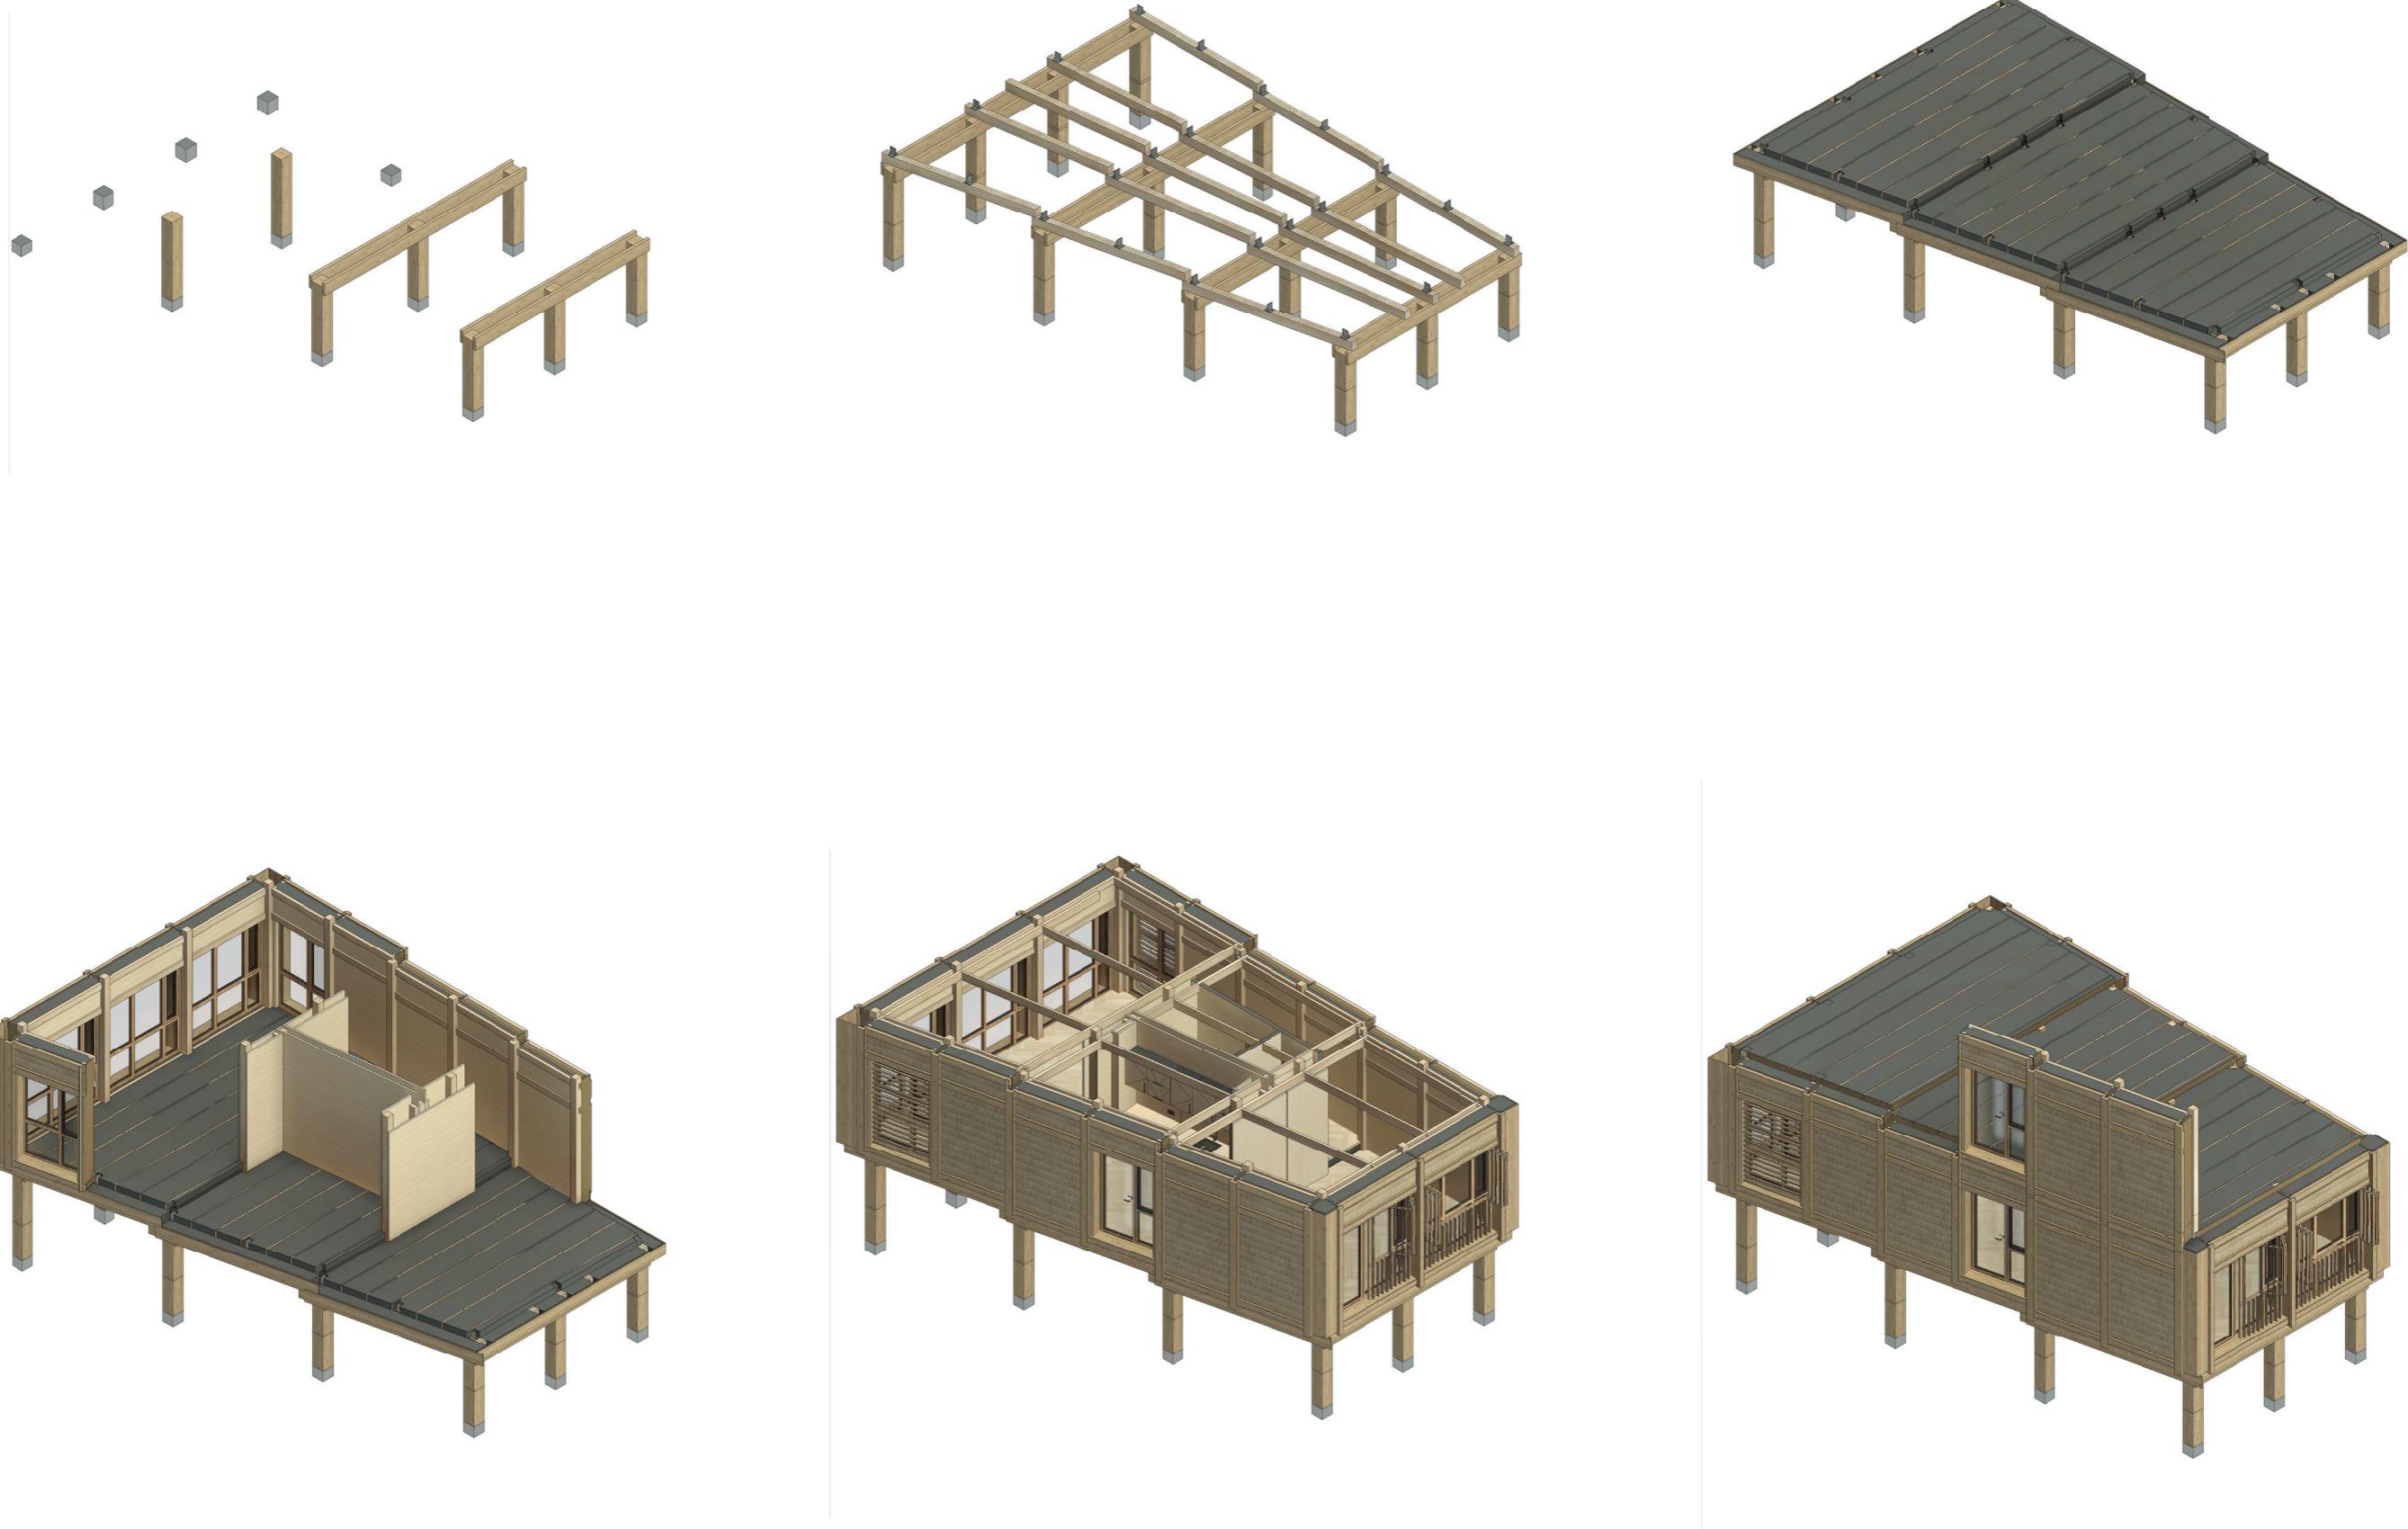

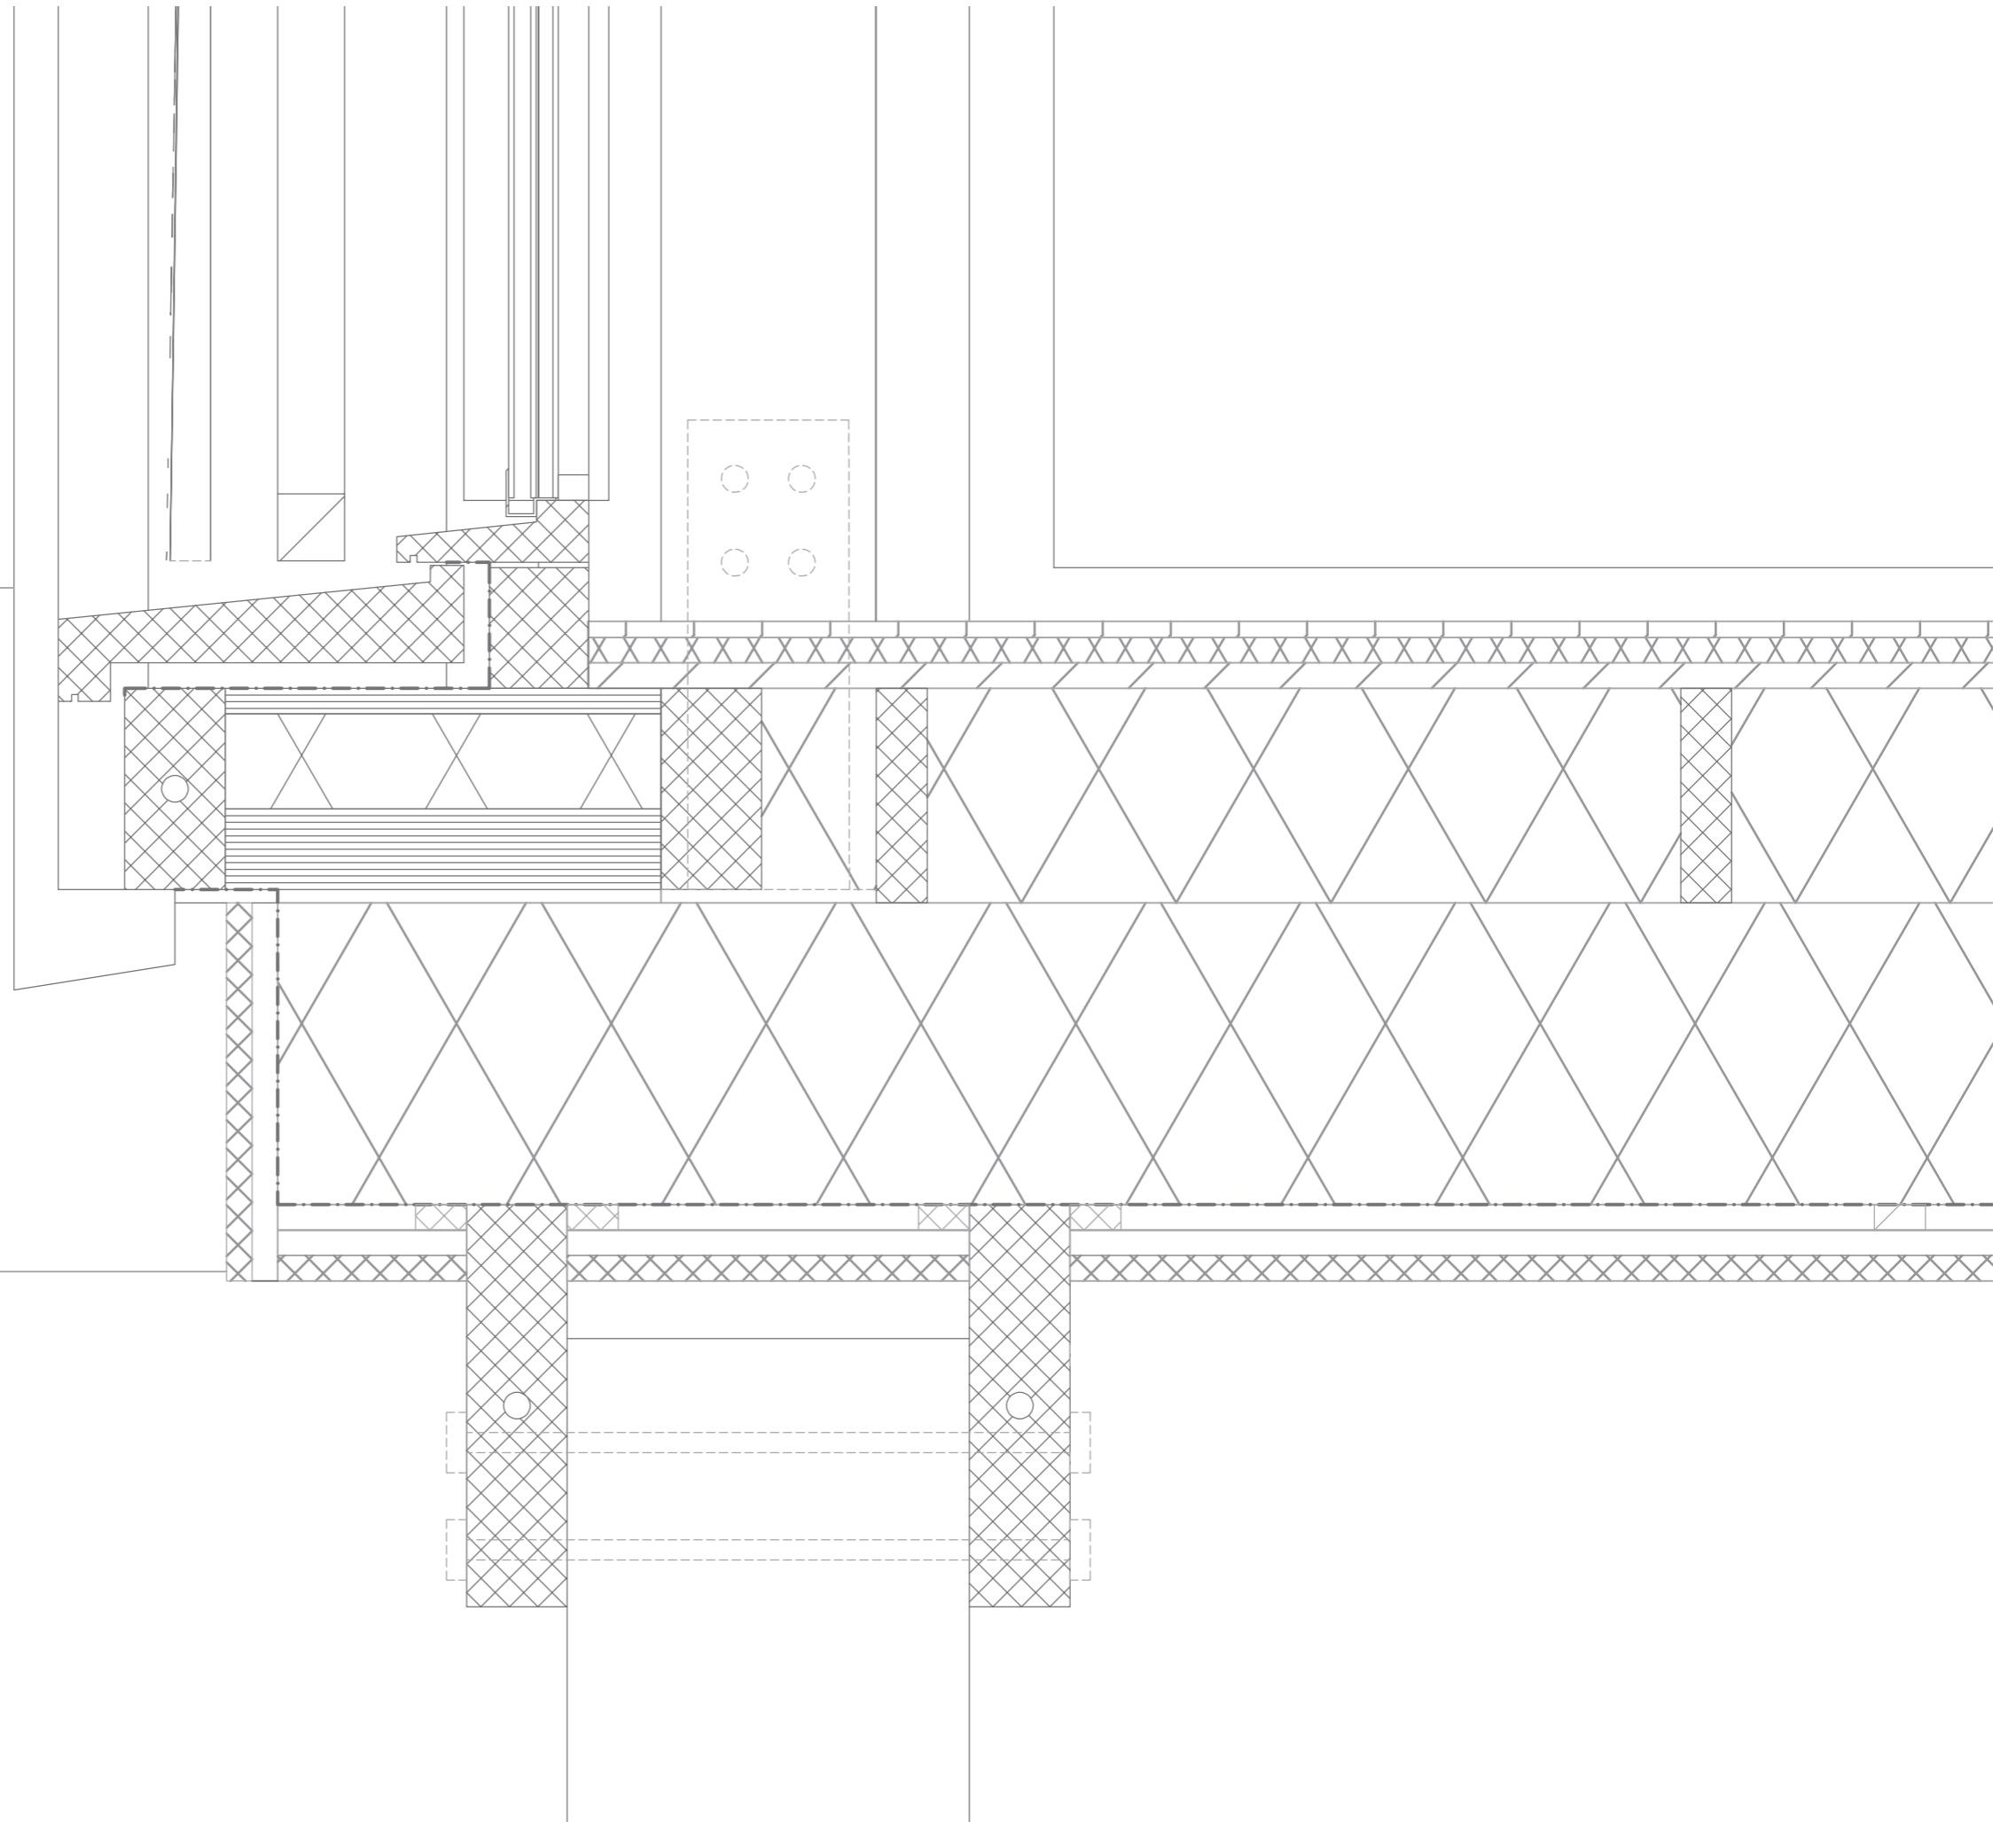

### Construction

- 160x160mm interior ash column
- Loadbearing typhaboard middle piece
- 120x120mm exterior decored oak column

Sandwiched by two facade panels

Elm windowframes

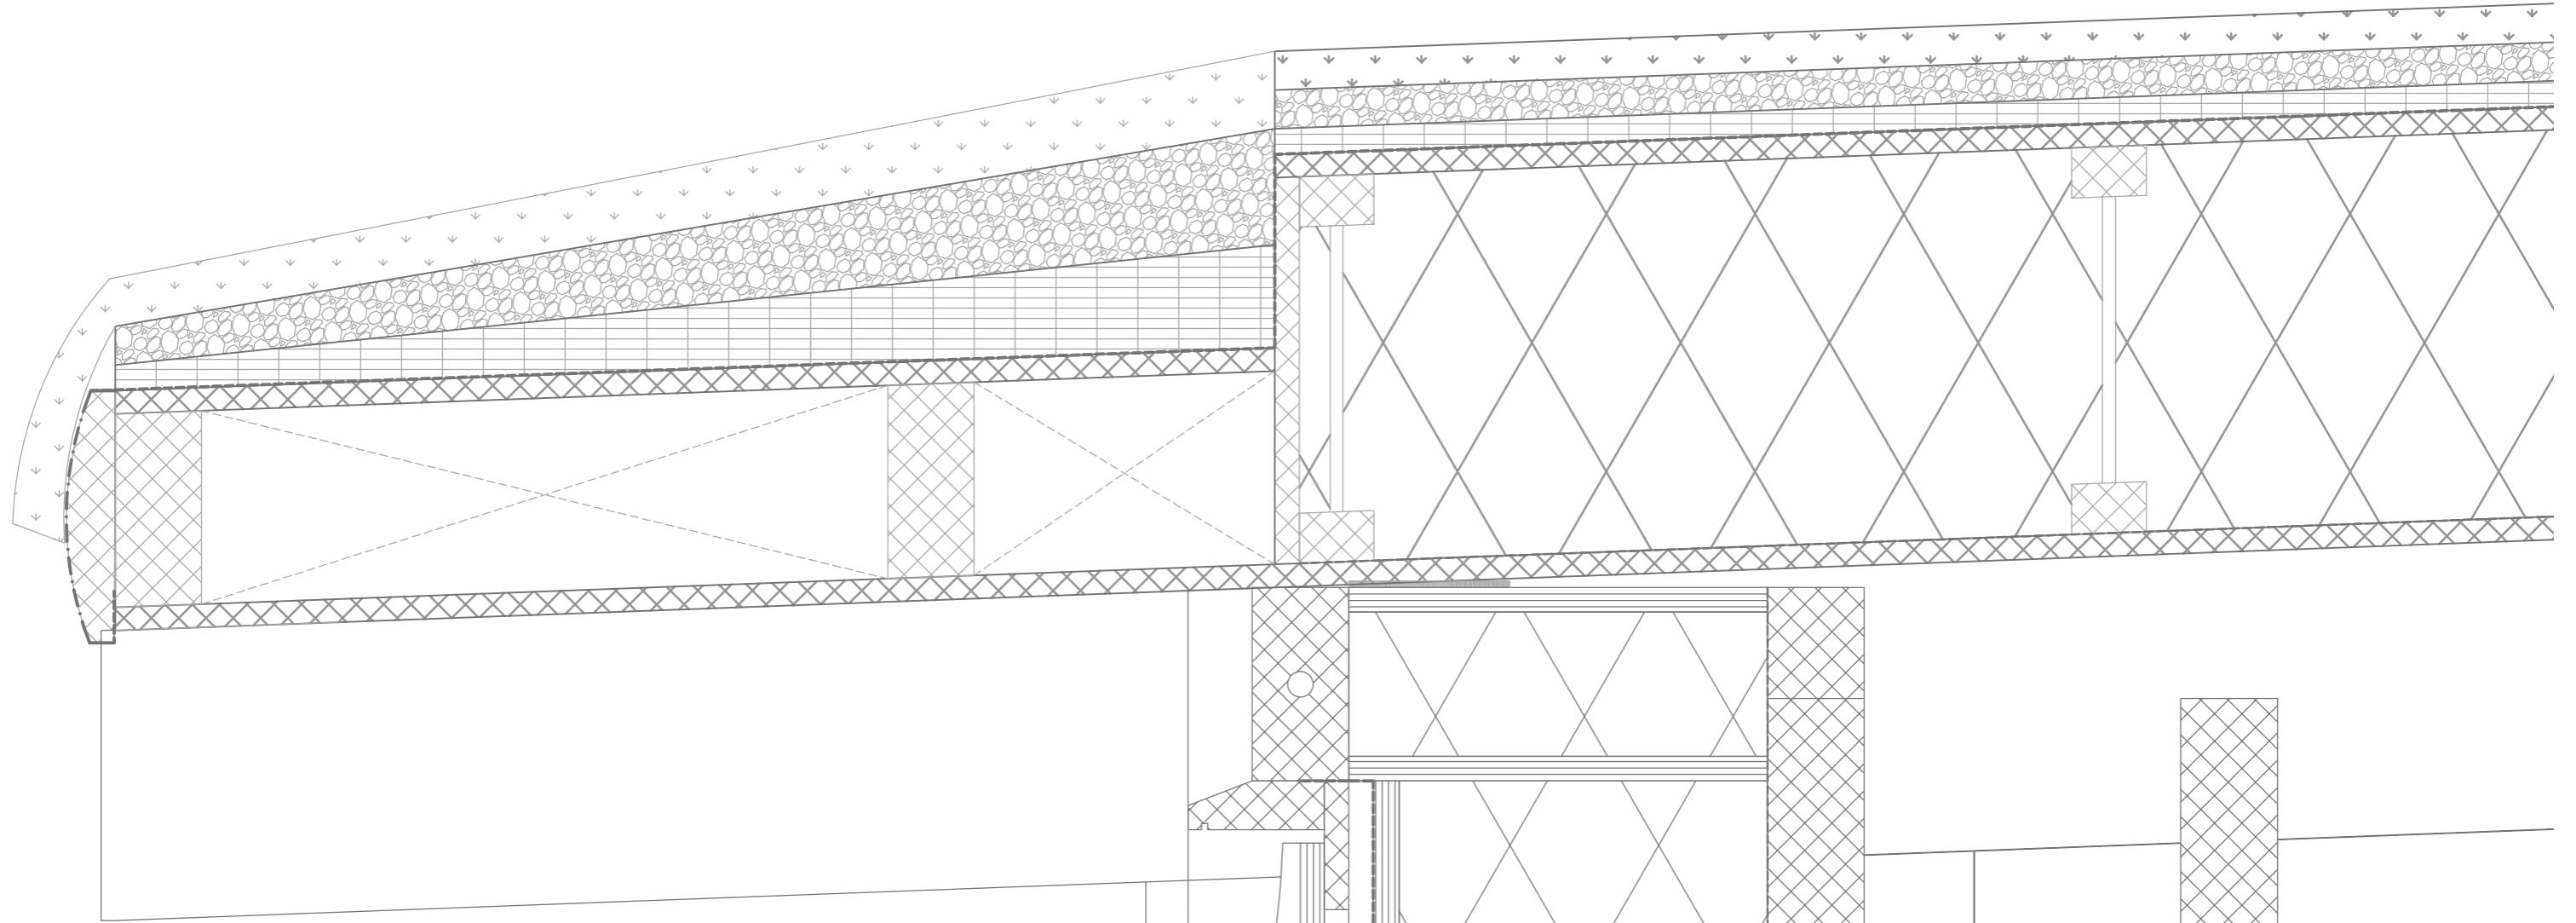

**Construction:**

- 18mm Birch parquet flooring
- WEM fussbodemheizung system, made of woodfibre insulation and interlocking timber beams.
- Woodfibre insulation
- 3 double ash beams 225x75
- Water retaining, damp open layer
- Elm foundation board on rafters for good ventilation
- 300x75mm double decored oak beams with adjustment room
- 1,5-2,5m Oak pile foundation piece
- 12,5m Alder foundation piles

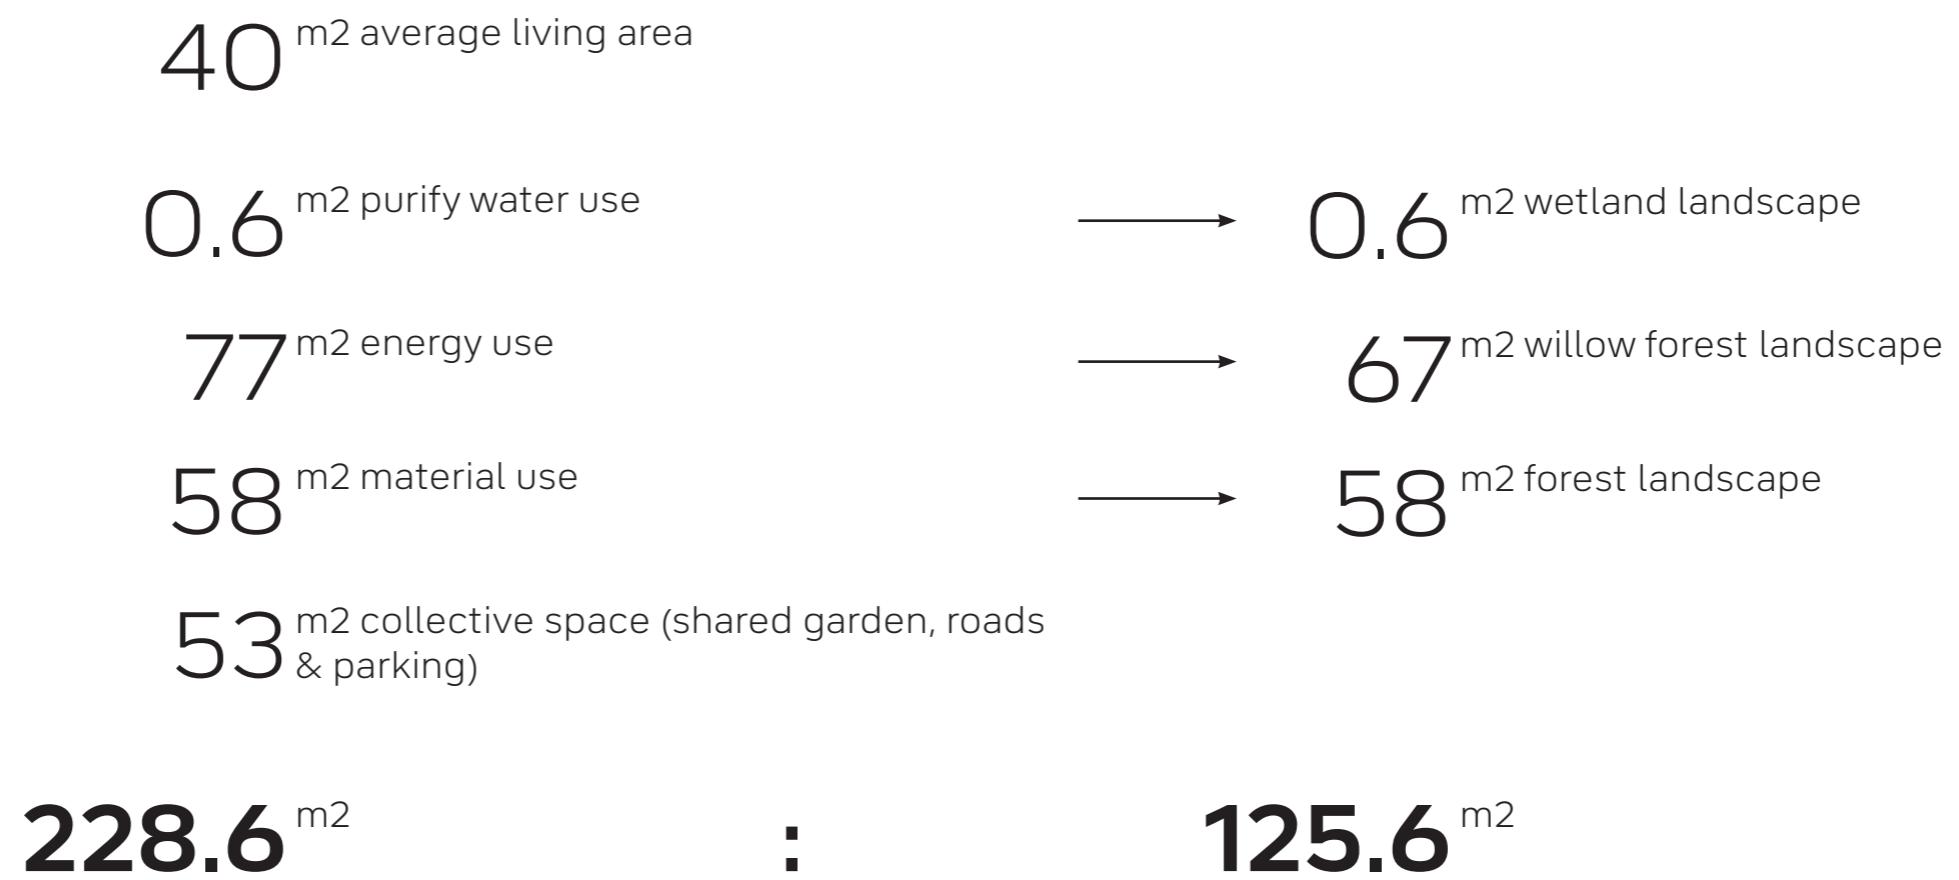

#### Construction

- 75x150mm decored oak beams with dissambleable oak sills (stainless steel screws)
- Reed screwed on a fireresistant typha board
- Elm horizontal and vertical rafters enclosed by oak sills
- Water retaining, damp open layer
- 285mm wood fiber insulation
- Vapour barrier
- 38x175mm poplar planks
- 75x150mm ash beams

**Does this ratio define the maximum ecological density of the island?**
