

P5 Graduation - 04/07/2014

POLYCARBONATE MEDIA FACADES

Student : Ioannis Gkikas

1st mentor: Prof.dr.ing. Ulrich Knaack

2nd mentor: Ir. Joris Smits

External examiner: Ir. Cecile Calis

The problem statement

My fascination when applying to TU Delft
(media facades)

- Facade companies' opening in NL investing in media facades
- Marketing importance and advertisement
- Media facade for an office building by Rollocate
- Upgrade polycarbonate facades

Building examples(case studies)

Rodeca

Rollecate office

Criteria

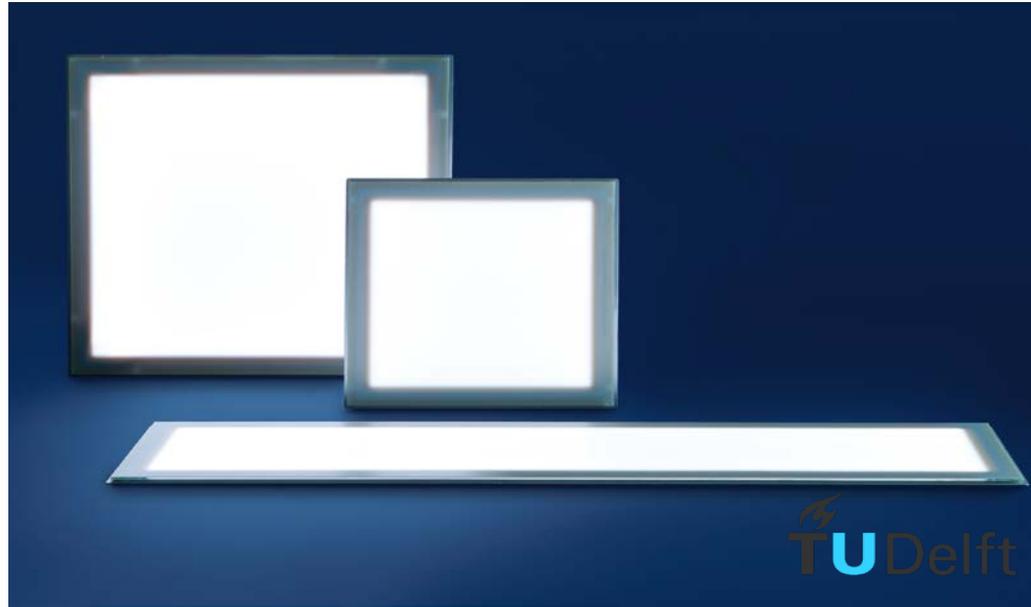

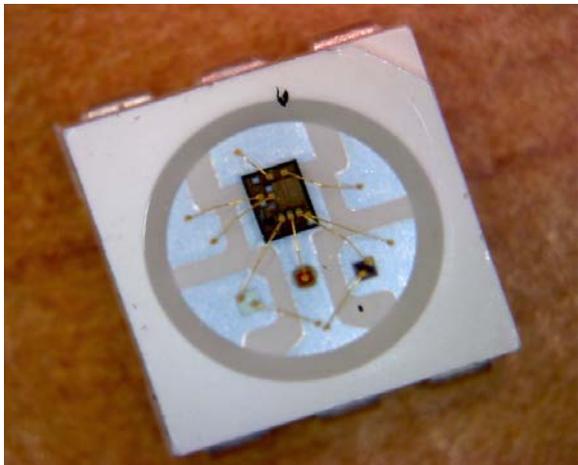

What is the state of the art technology to design a multimedia facade and which are the ways to improve it?

- **Transparent** material (not a totally blocked view)
- Good quality **graphics** (videos and images)
- Competitive **price** (comparison)
- **Maintenance** and reversibility (fixing possibilities)
- **Day** and **night** use (intensity of lights)

Simple &
cheap
solution

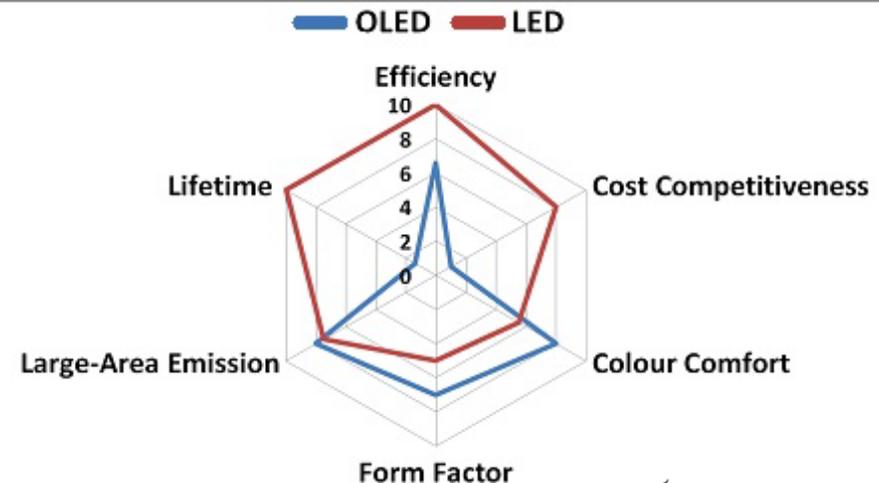

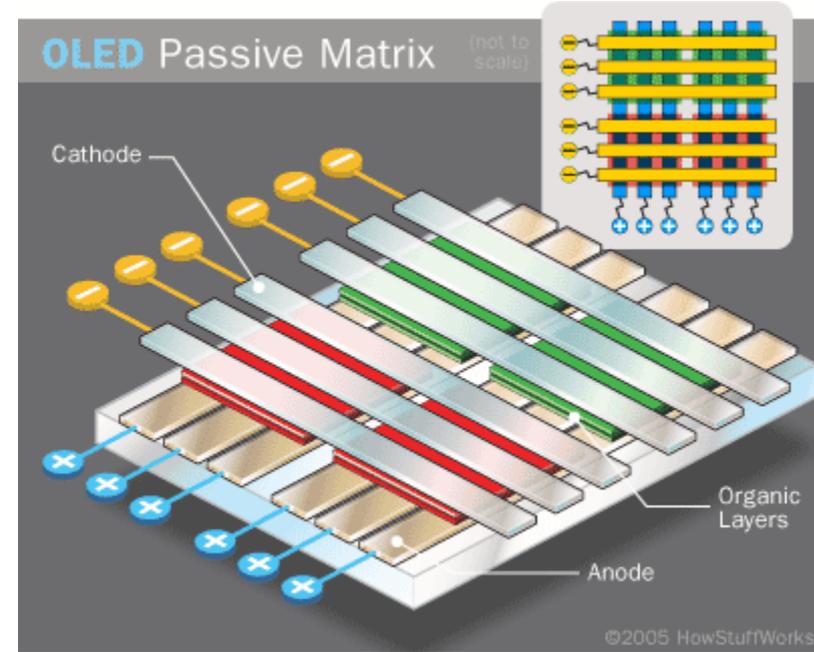

First part of the research

- Related to media facade technologies and costs
- What technology do they use?(LEDs and OLEDs)
- LEDs and OLEDs (lifetime, efficiency, cost, brightness)

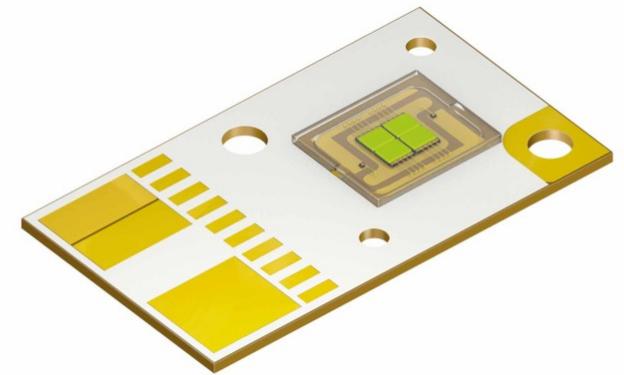

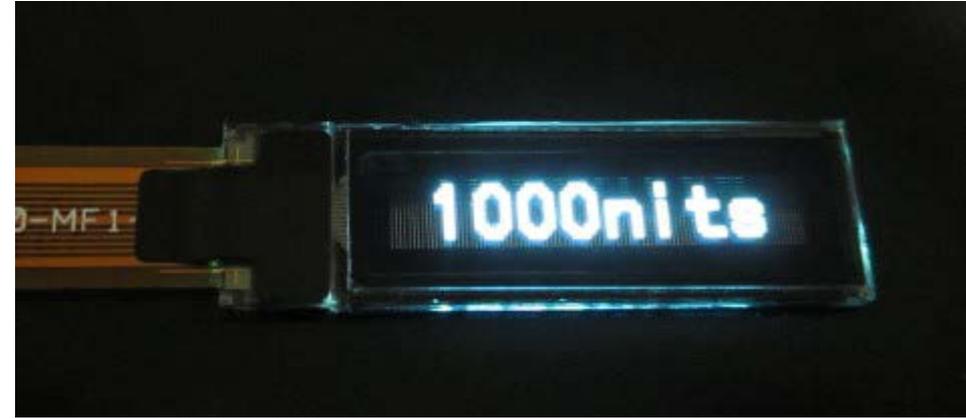

LEDs and OLEDs

- Limited lifetime of the **organic materials** (carbon)/thinner layer/sensitive to oxygen/UV exposure (degradation). Life span of LEDs 50.000h - OLEDs 15.000h
- Efficiency (how well a light source produces visible light) of OLEDs is 100lm/W under test while on LEDs 200lm/W in production
- Manufacturing processes are too expensive and under testing constantly

LEDs and OLEDs

- Brightness of LEDs already 1.700 nits and will reach 8.000 while OLEDs recently developed the first PMOLED with 1.000 nits

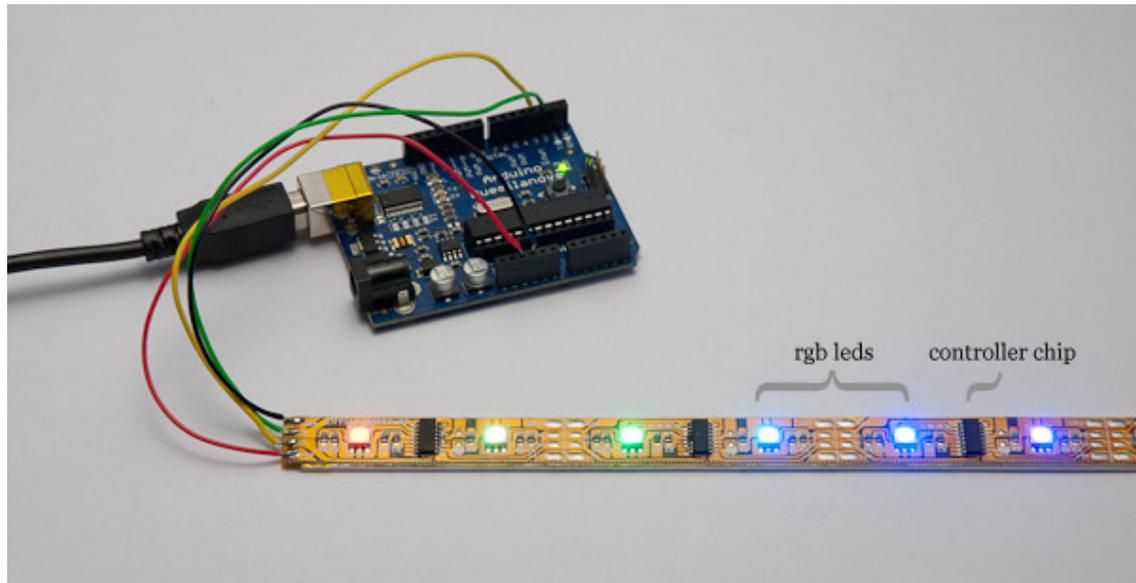

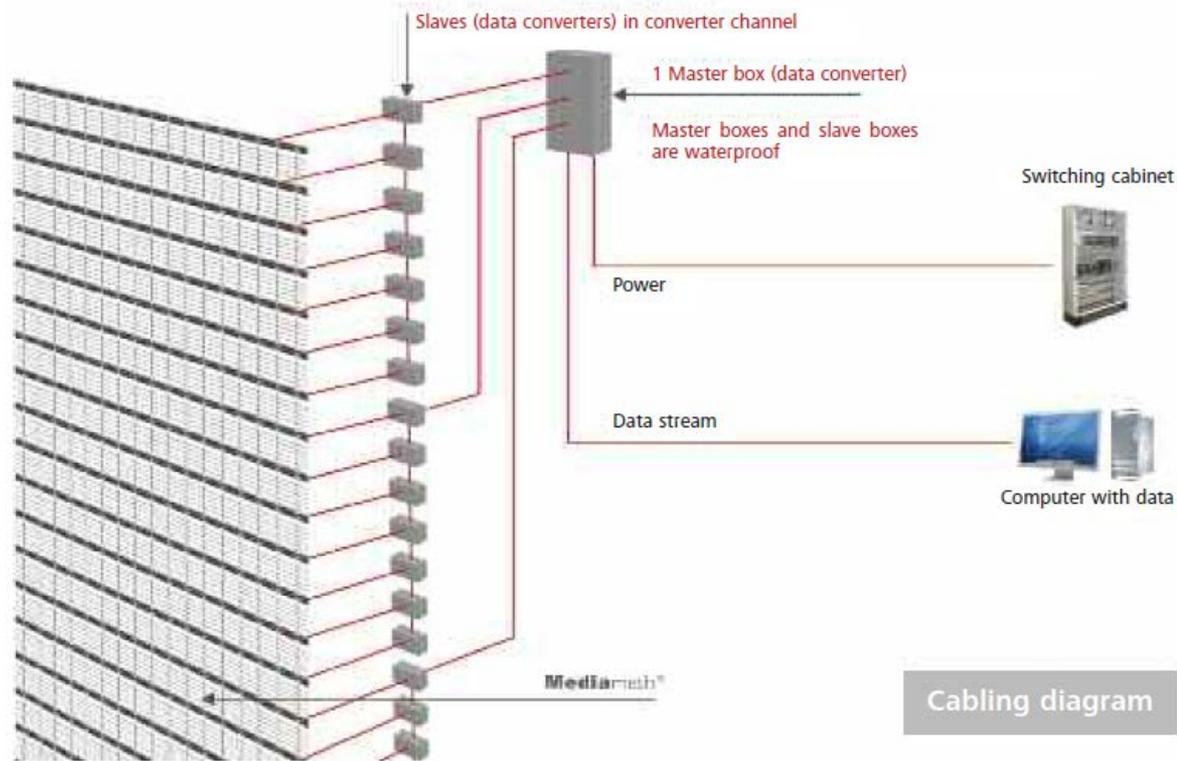

- OLEDs are more appropriate for small applications to achieve high contrast and resolution

Addressable RGB strip

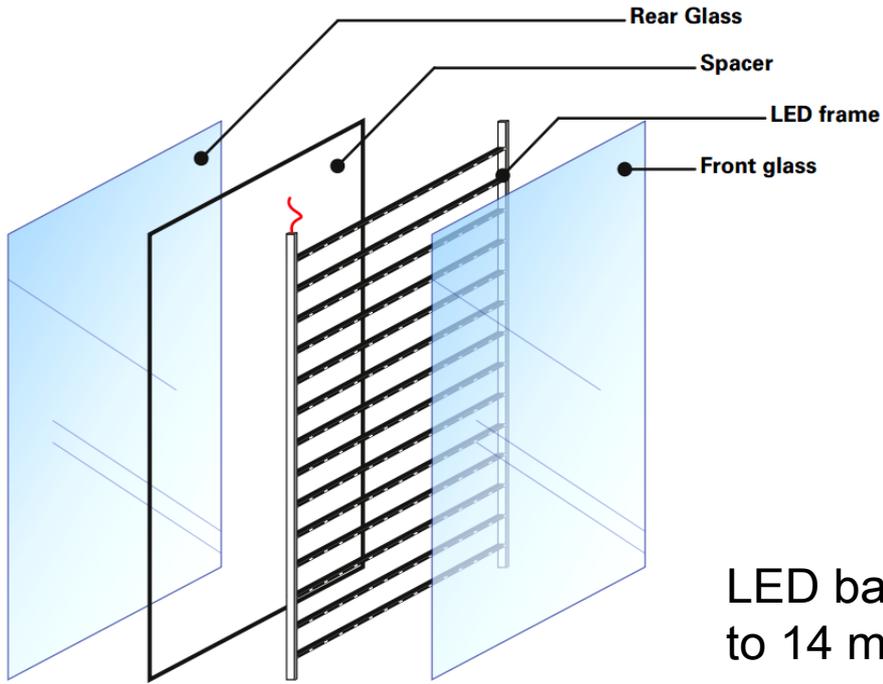

What is the technology to produce animated images with LEDs?

- **GND** = Ground(close the circuit)
- **Di**= **Data in** (data input for the controller chips)
- **5V**= **Volts** (power supply)

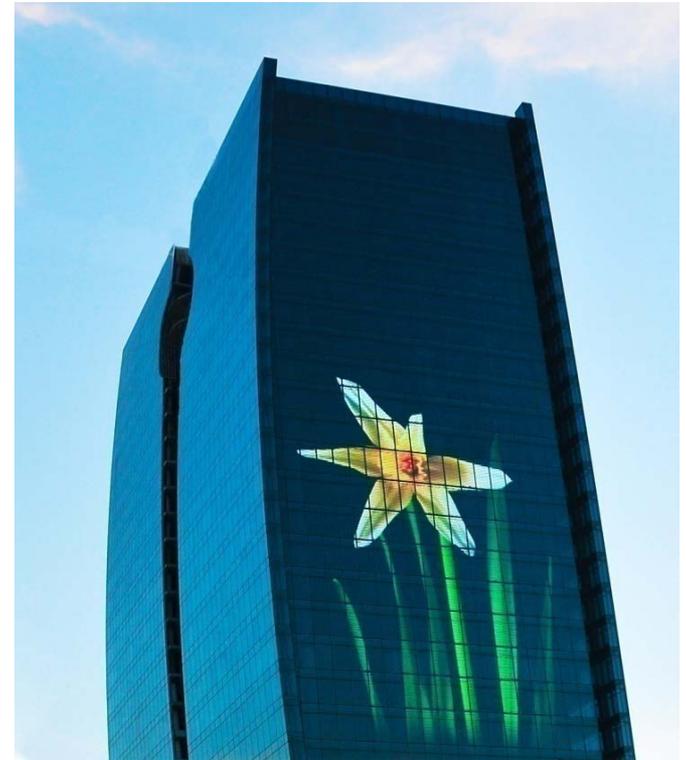

Chips between LEDs take commands from a microcontroller

Media facade technologies

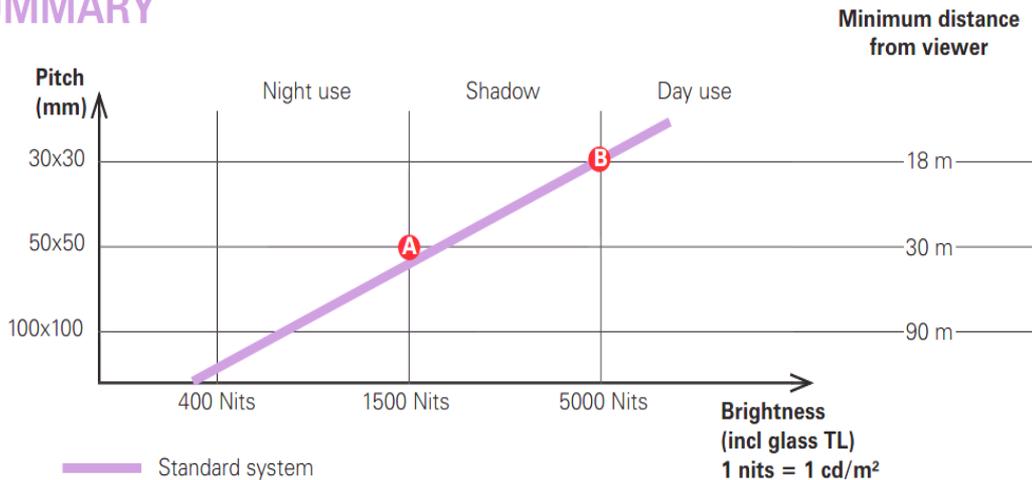

LED bars are 8 to 14 mm thick

King's Road Tower, Jeddah

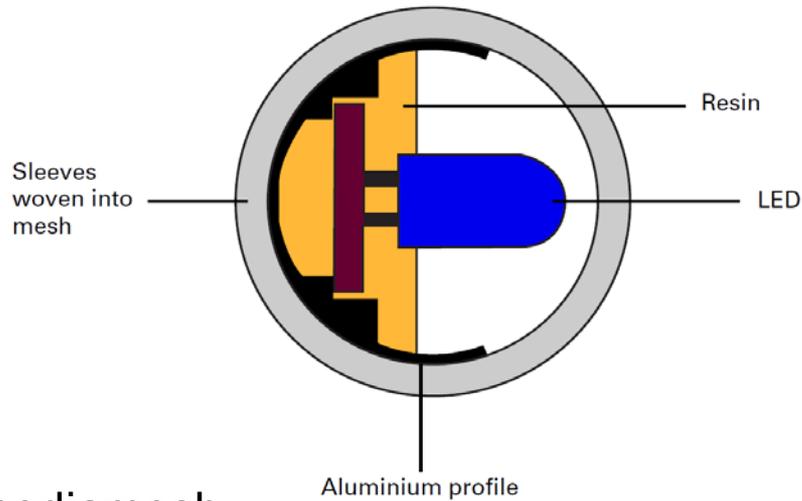

SUMMARY

- Black grid
- Maintenance

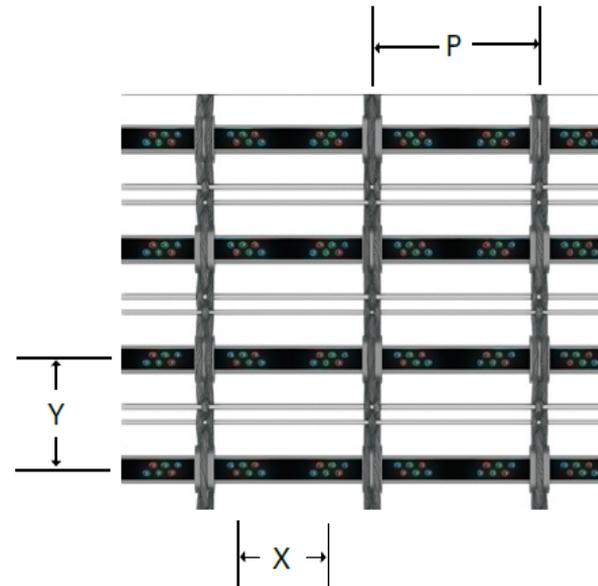

Media facade technologies

Specification	V4xH5.0	V5xH5.0	V6xH5.0
Vertical LED Pitch	40mm	50mm	60mm
Horizontal LED Pitch	50mm	50mm	50mm
NIT m ²	7766-9527	6213-7621	5177-6351
Open Area	56.2%	58.1%	59.4%
Viewing Distance	35m/115ft	35m/115ft	42m/138ft
Weight (lbs per ft ²)	1.9	1.77	1.7
Rods Between LED Tubes	1	2	3

*table data February 2013

mediamesh

P= cable pitch
 X= horizontal pixel spacing
 Y= vertical pixel spacing

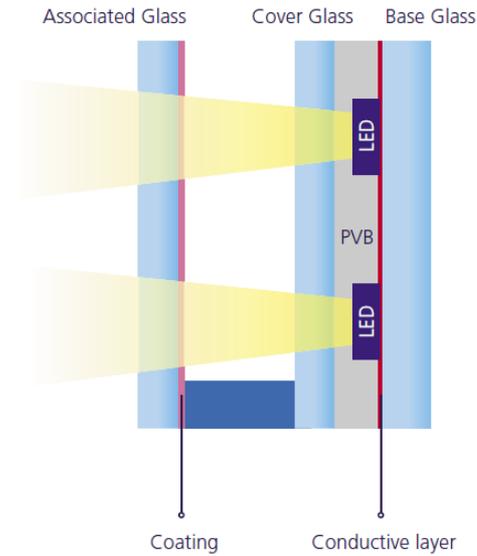

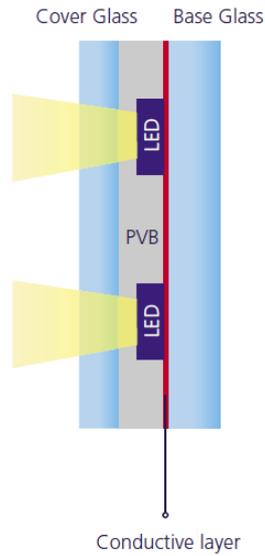

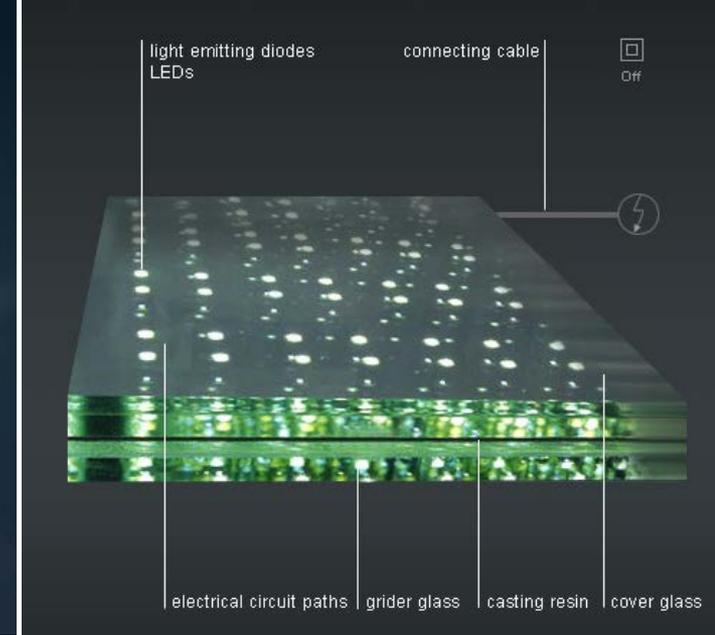

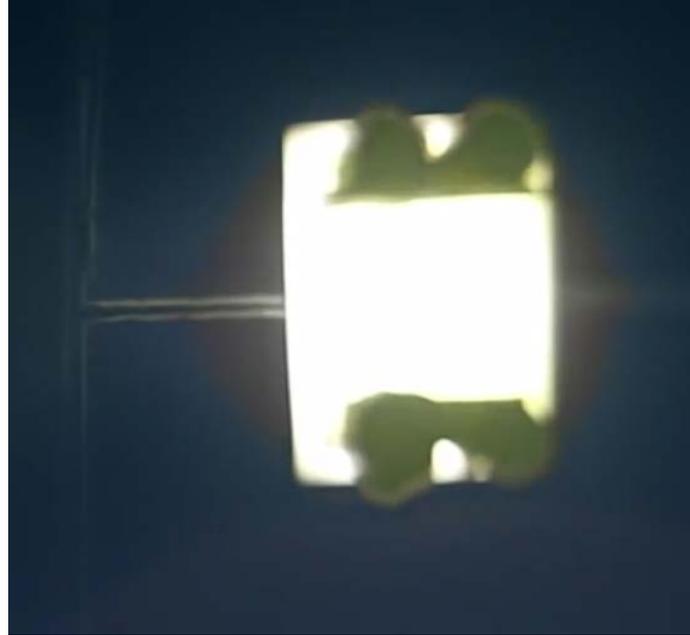

- Maintenance
- Additional element

Powerglass

- Transparent wires but limitation in pixel pitch, graphics and serviceability

Cost of media facades

Filters:

- good quality **graphics**,
- **day-night** use,
- **top** companies
- **light transmission** allowance

Depends mainly on **pixel pitch** and **brightness**

GKD 7.000€/m²

Bus Authority 557m² - 4 million €

Pixel pitch 50 mm

Brightness 4.730 nits

LEUROCOM 7.000€/m²

Imaginarium 23m² - 160.000 €

Pixel pitch 25 mm

Brithgness 5.000 nits

Rollecate media facade cost

Brakel Atmos

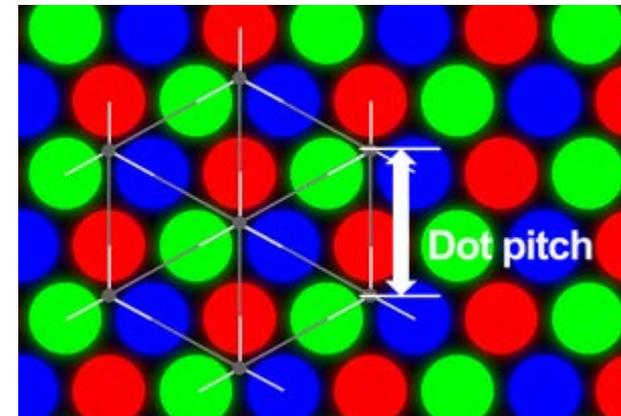

32 m² 203.000 €

6.000 €/m²

Pixel pitch 45 mm

Britghness 5.000 nits

Day and night use

Philips

63 m² 213.000 €

3.400 €/m²

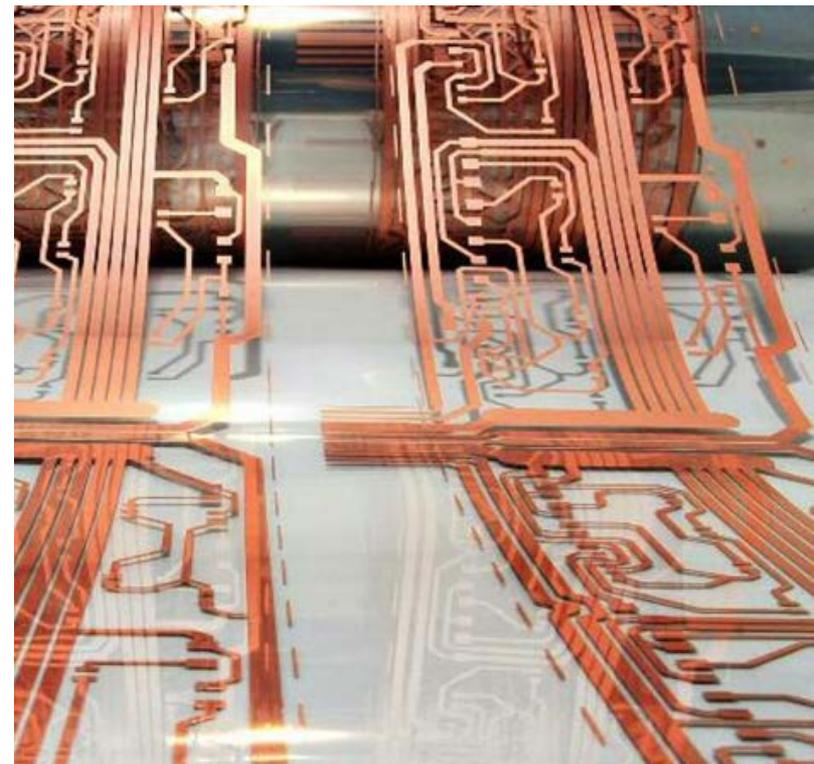

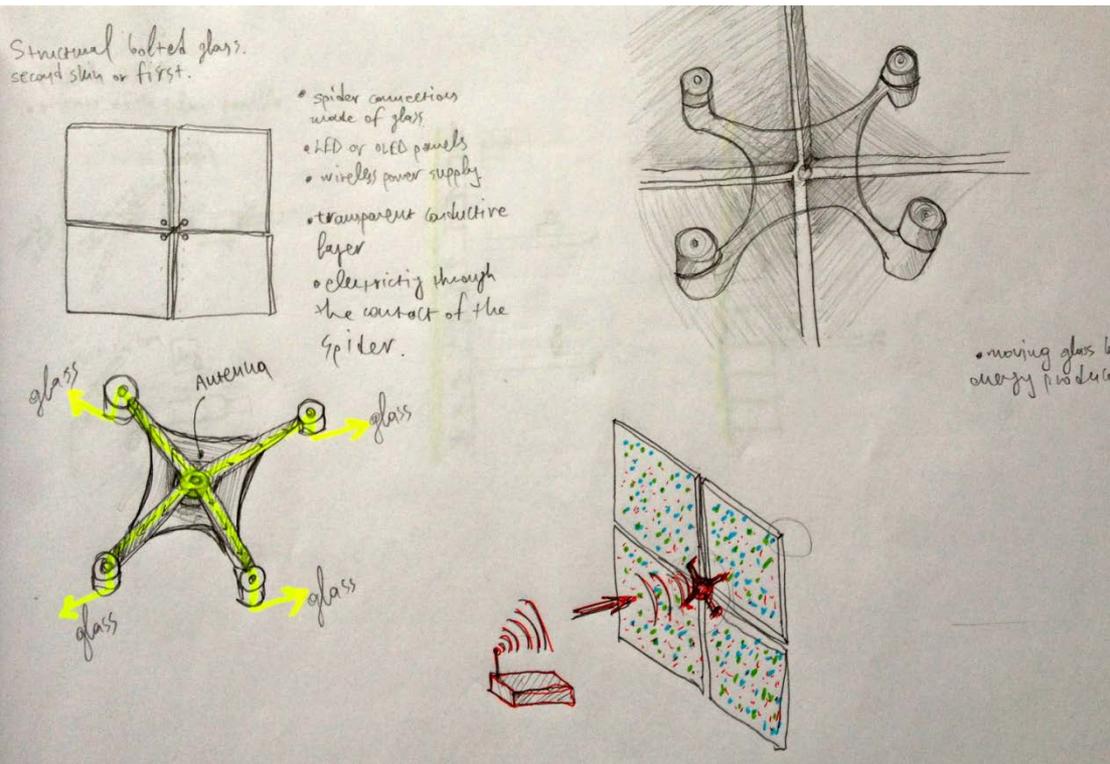

Pixel pitch 50 mm

Britghness 1.040 nits

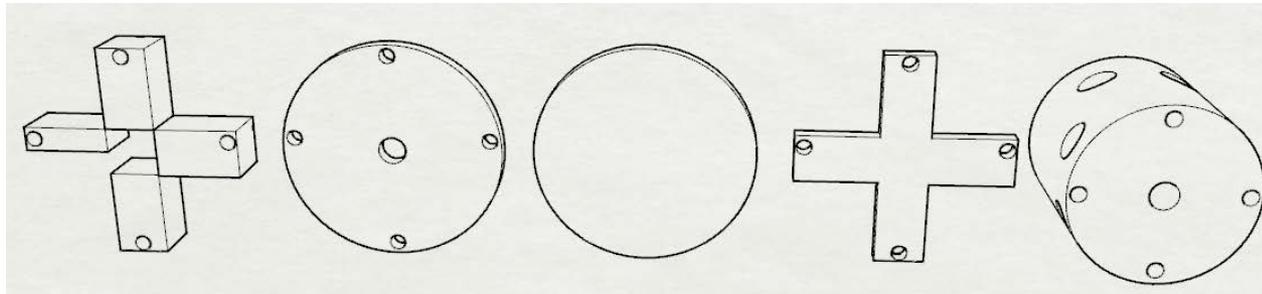

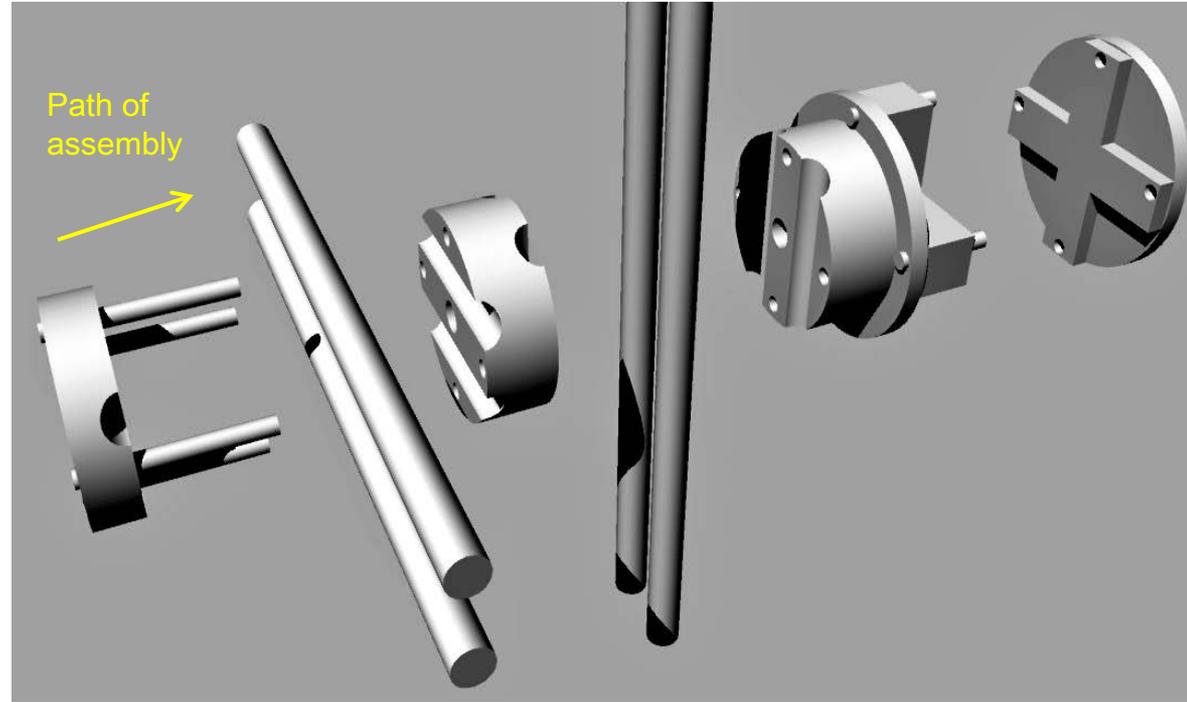

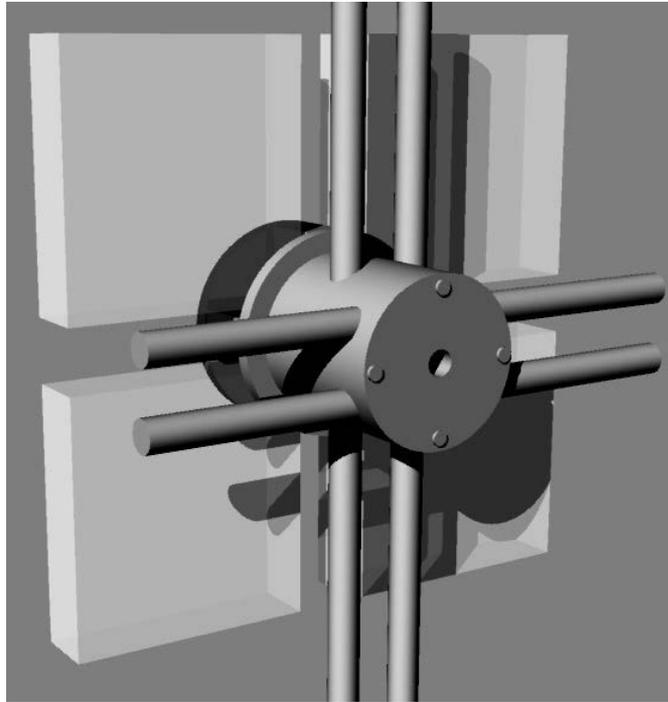

Night use

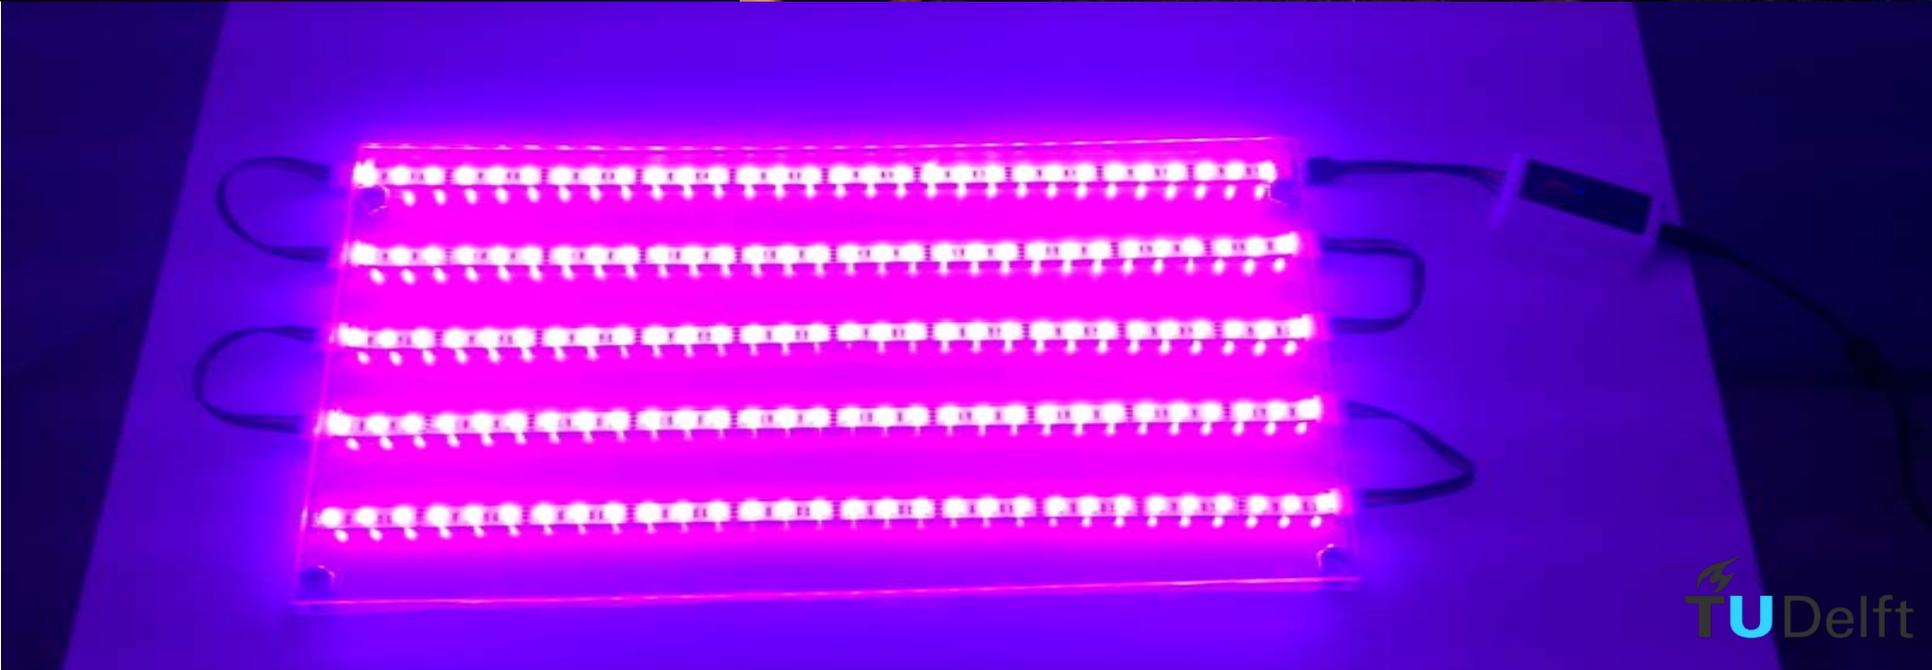

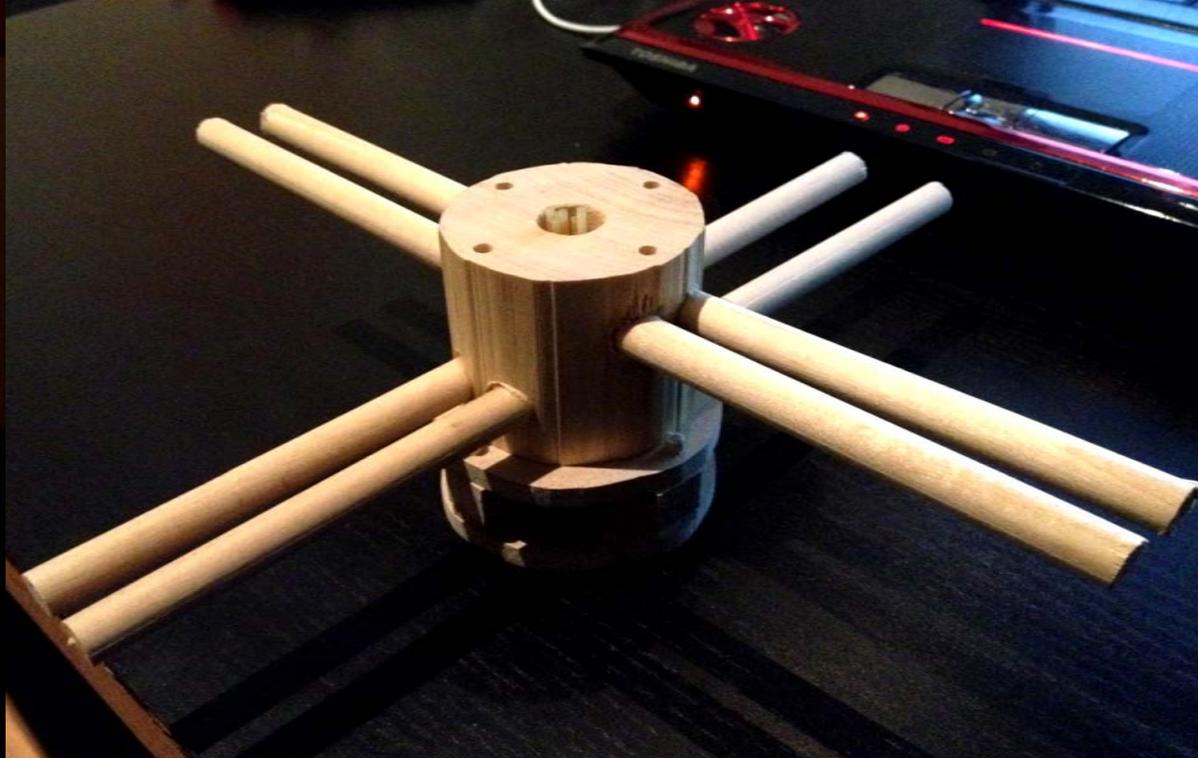

1st design attempt

- Glass integrated LEDs with no mullions
- Minimise the connections between the panels and spider glazing solution
- Use of transparent PCB circuits for more light transmission

2D planar component

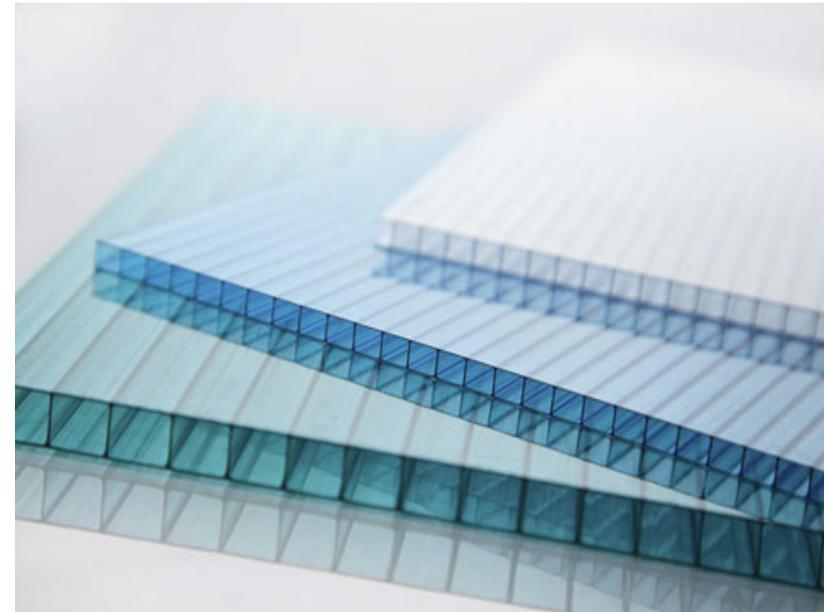

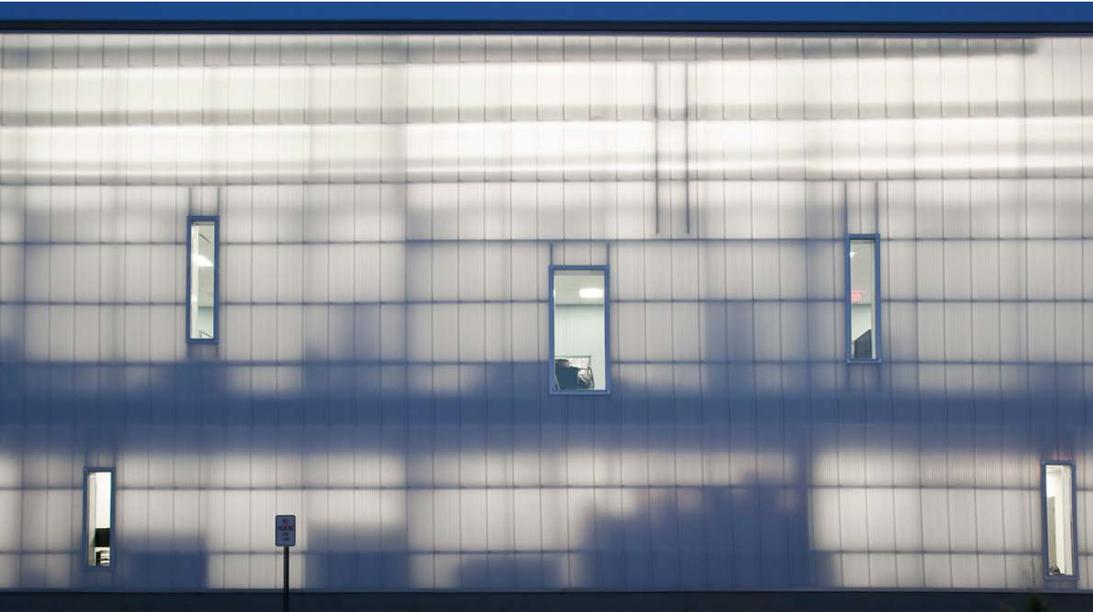

Issues

- Spider glazing is used to **minimize** dimensions of panels while here are 1,5 x 3 m
- This façade system allows **deformation** up to 50mm so cables on the slab will be damaged
- **Maintenance** issues for the LEDs (whole panel needs to be changed)
- No **sun shading** integrated
- **Limitation** in pixel pitch with the intermediate mullions

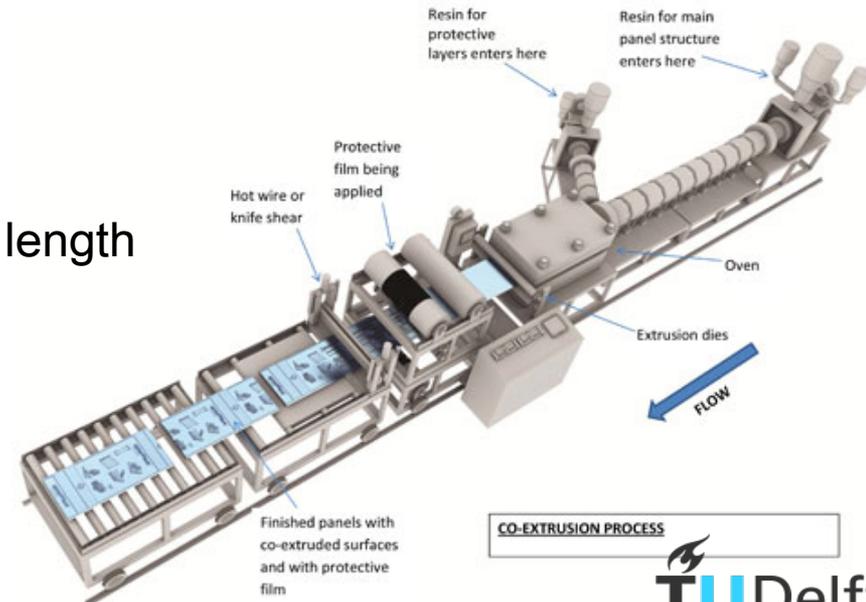

Second part of the research(Polycarbonate structural sheets)

Polymers containing carbonate groups

Production: extrusion technology up to 30 m length

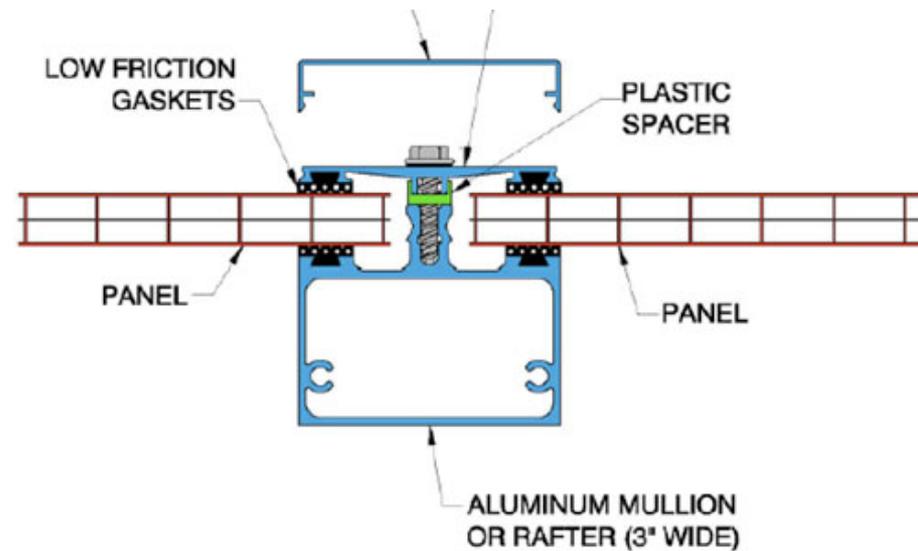

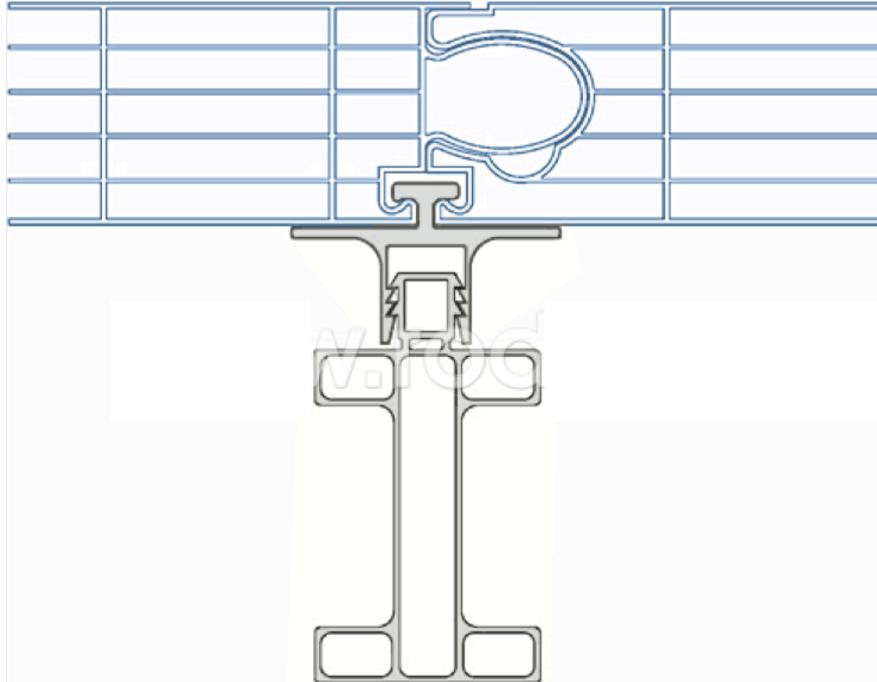

- impact resistance
- optical properties
- temperature and fire resistance

Multiwall systems

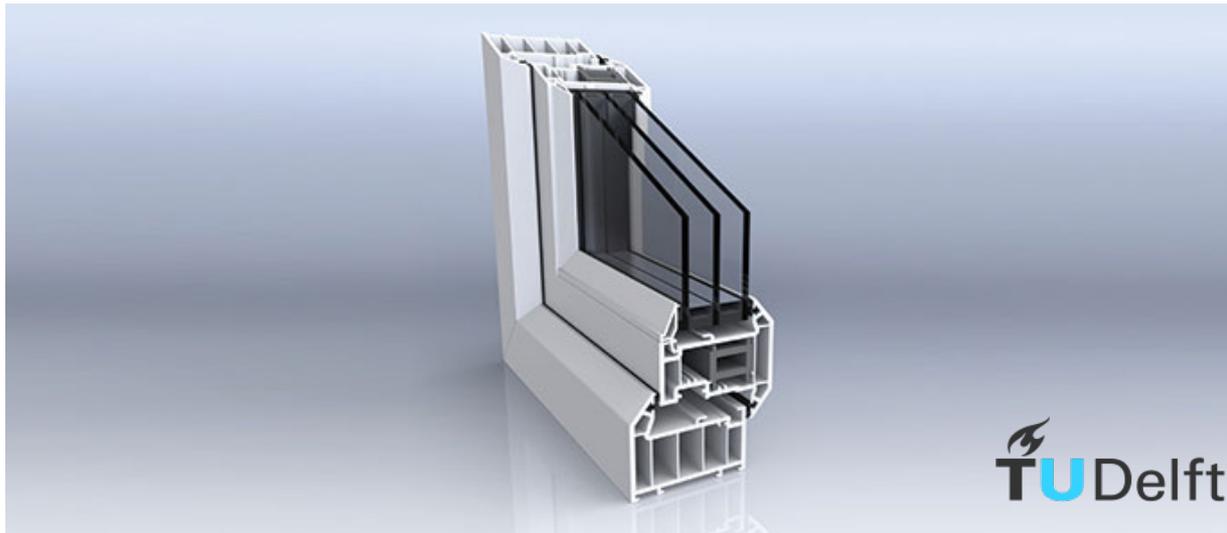

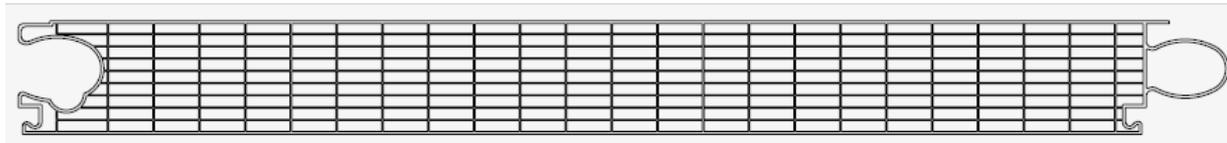

- Click system
- Curtain wall
- Several thickness
- Versatility for any facade
- Colour variety

PCSS vs Glass

- Brittle resistance 20 times more
- Ultimate strength 2 times more
- Better thermal resistance (U-value up to 0.83 – like triple glazed with argon and low-e coatings)
- Lighter weight 10 times
- Cold bending
- Cheaper solution
- Light and simple framing

		Polycarbonate PC	Glass
Mechanical Properties			
Density (ρ)	Mg/m ³	1.14-1.21	2.44-2.5
E-modulus (E)	GPa	2.21-2.44	68-72
Poisson's Ratio (ν)	dimensionless	0.38-0.42	0.2
Yield Strength (σ_y)	MPa	58.6 - 70.0	31-35
Ultimate Strength (σ_{ult})	MPa	65.0 - 72.4	31-35
Elongation at yield	%	6.00 - 50.0	0
Elongation at break	%	10.0 - 125	0

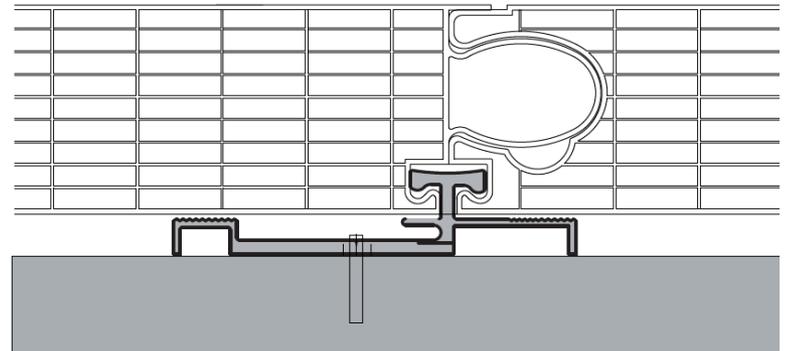

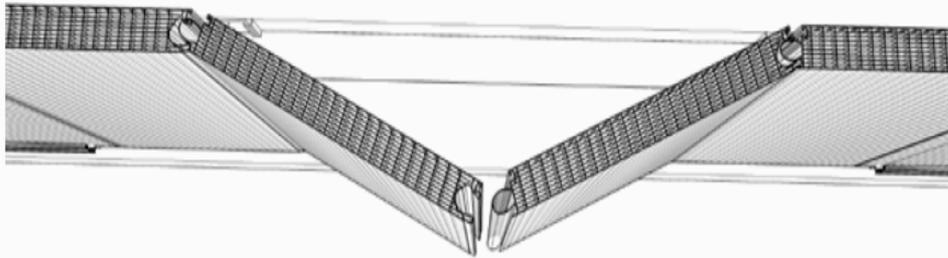

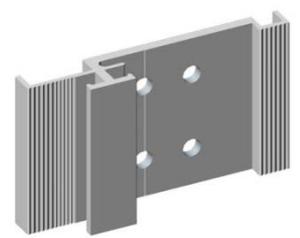

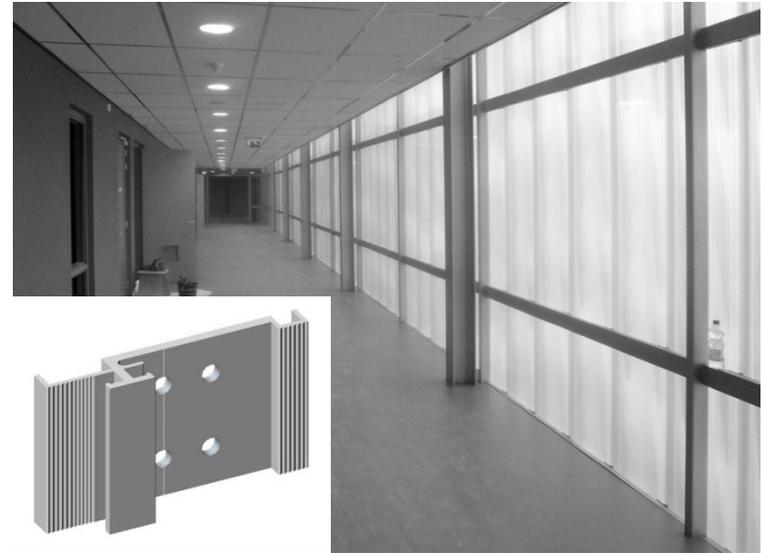

Glass vs PCSS

- Transparency
- Better fire resistance and lifespan
(Softening point 600°C)
- Less deformation so better Young's modulus

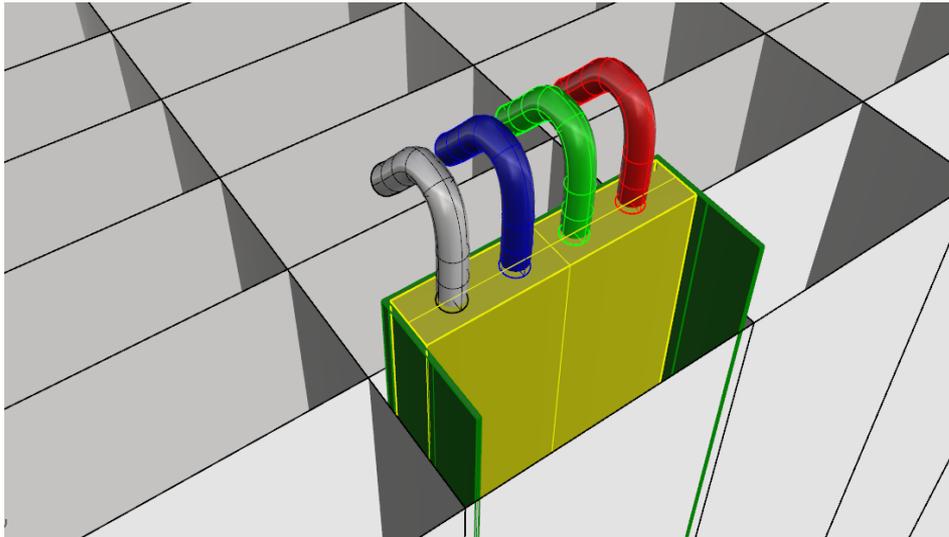

PCSS Reference projects

- Filter selection for walls
- Under structure
- Quicker and easiest installation for maintenance

Design stage (polycarbonate & LEDs)

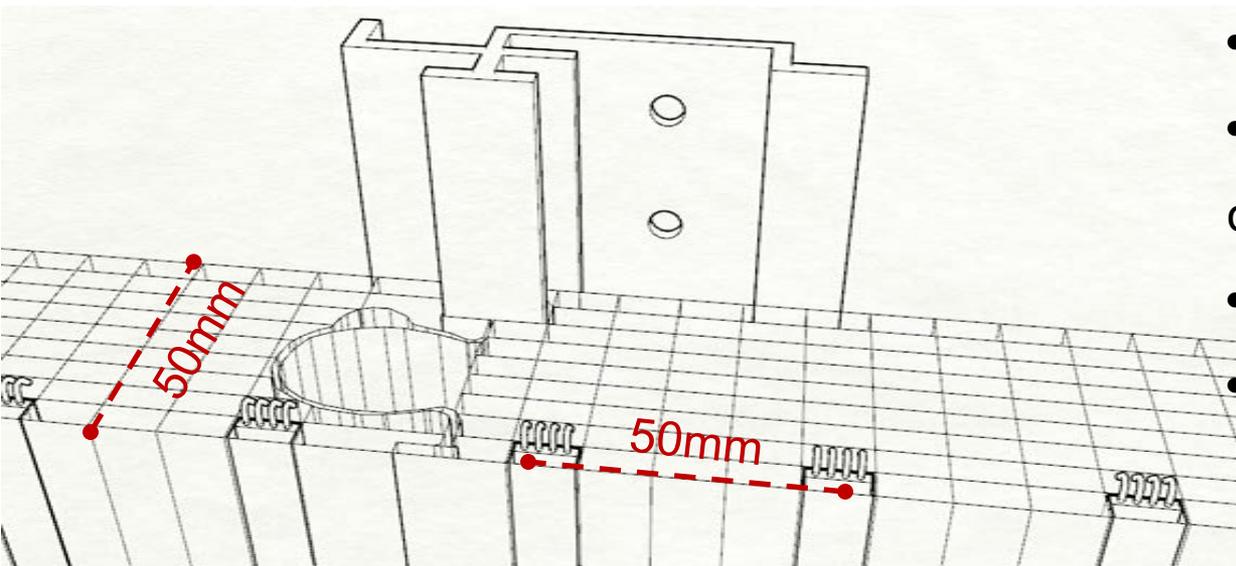

- Same product **lifespan** (10 years PCSS and 12 hours per day for LEDs)
- **Pixel pitch variety** starting from 12 mm
- **Temperature** checks for the combination
- Easy separation for **reuse** (polycarbonate is a thermoplastic and LEDs can be recycled)

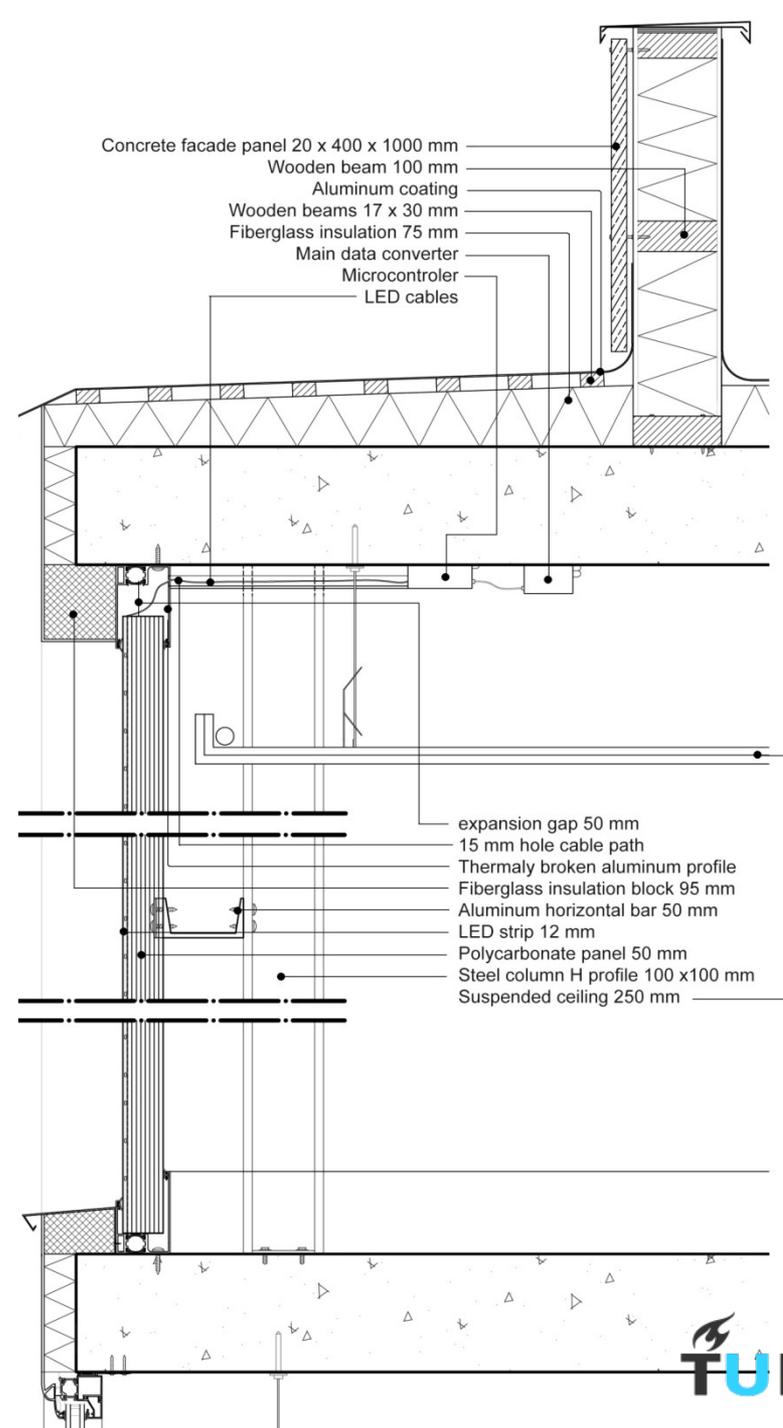

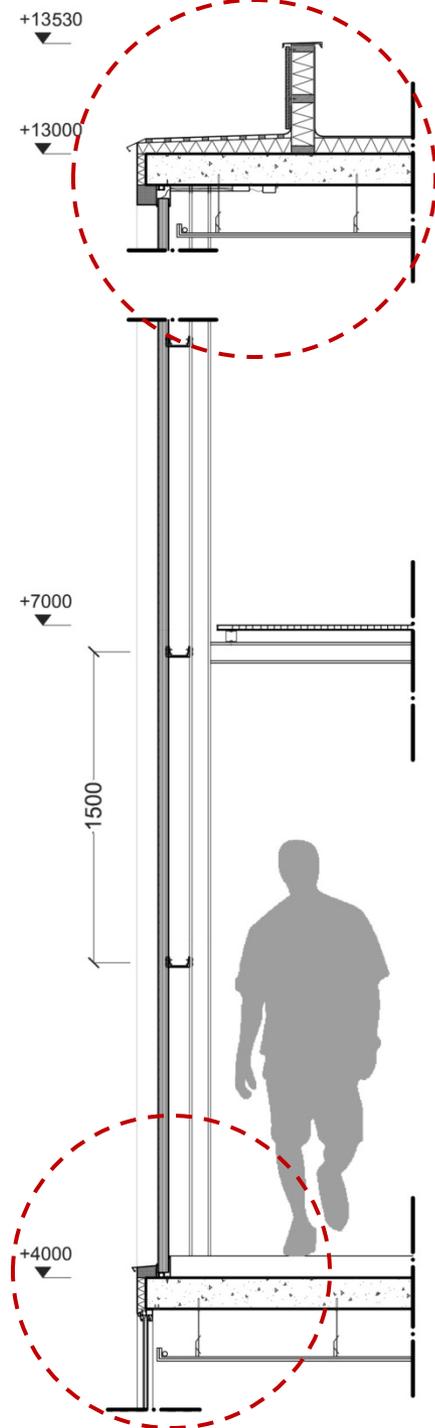

Pixel pitch (mm)	Minimum viewing distance(m) Multiply by 1400 mm
12	17
25	35
35	50
50	70
65	90
80	115
95	135

1st design

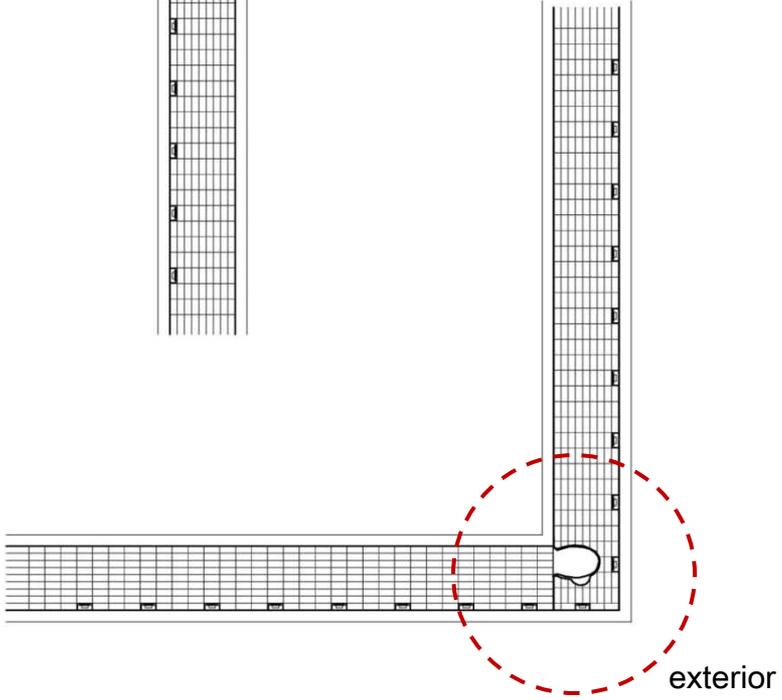

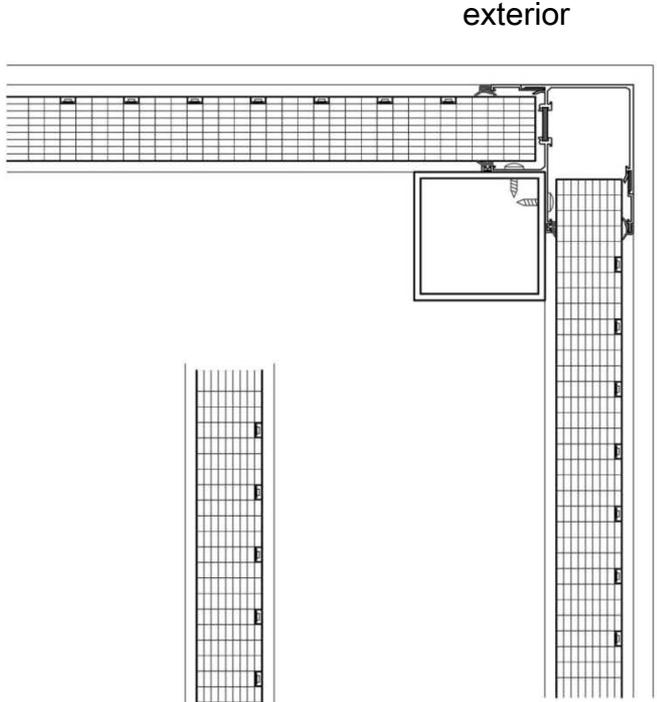

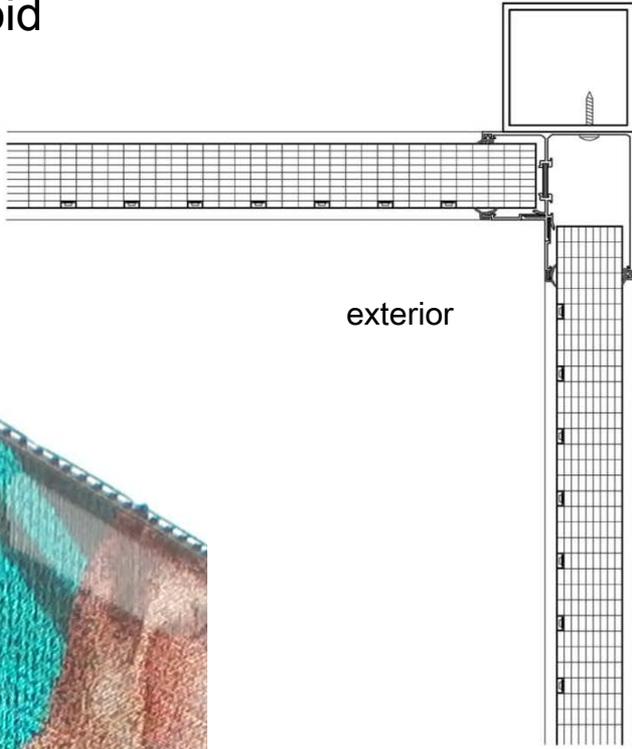

- 50 mm pixel pitch
- 5.600 nits
- Media facade for a raised shopping mall
- Example in Delft central square for distances

- Click fix system
- 50 mm thickness (most commonly used) 1 x 9 m
- U value 0,83 W/m²K
- Led strips every 4th chamber

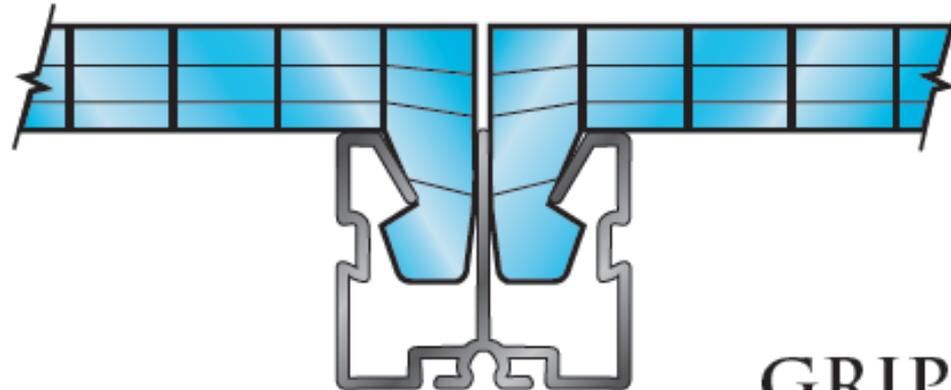

Corner details to avoid interruption of image

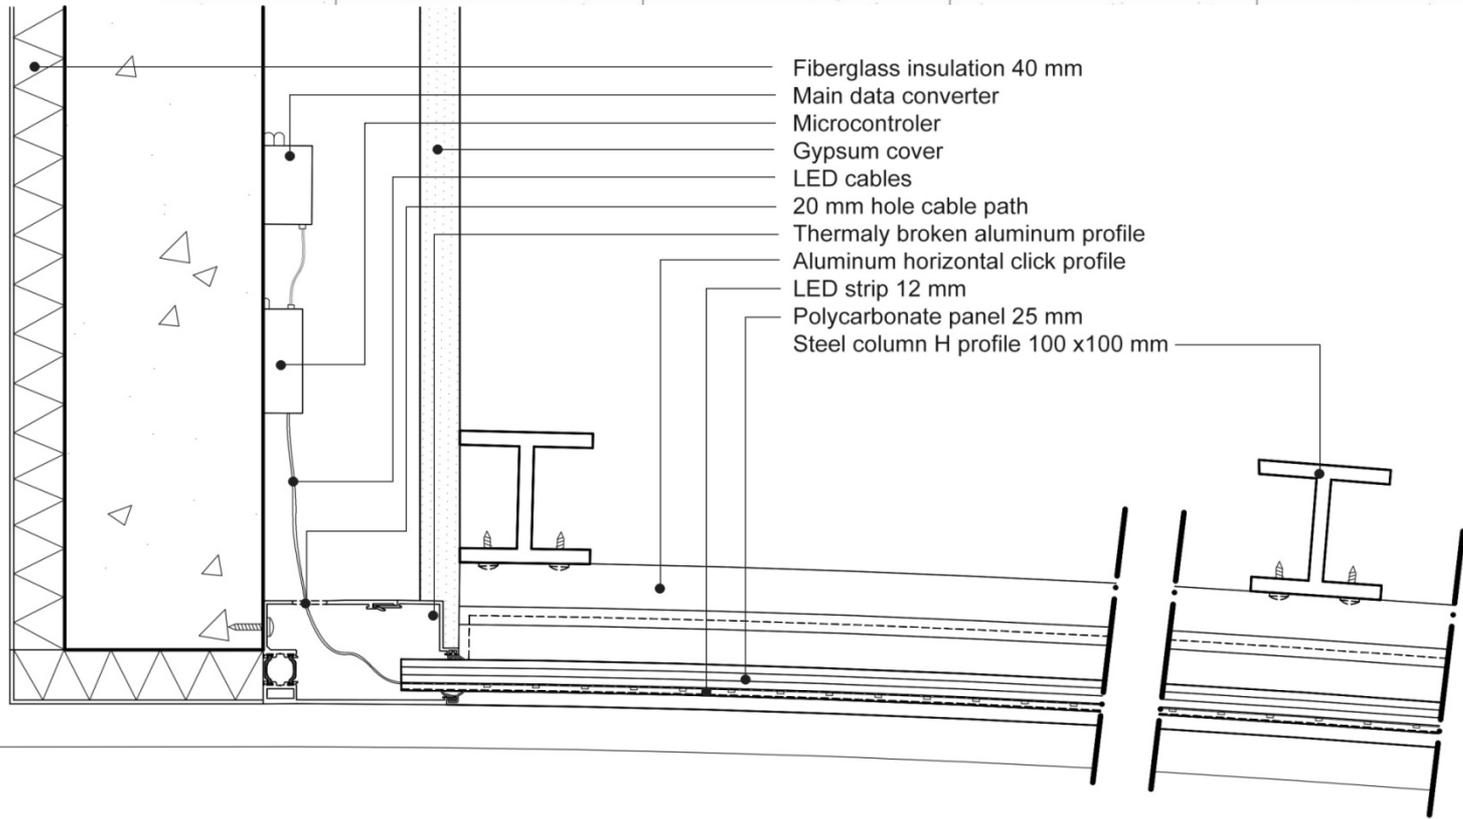

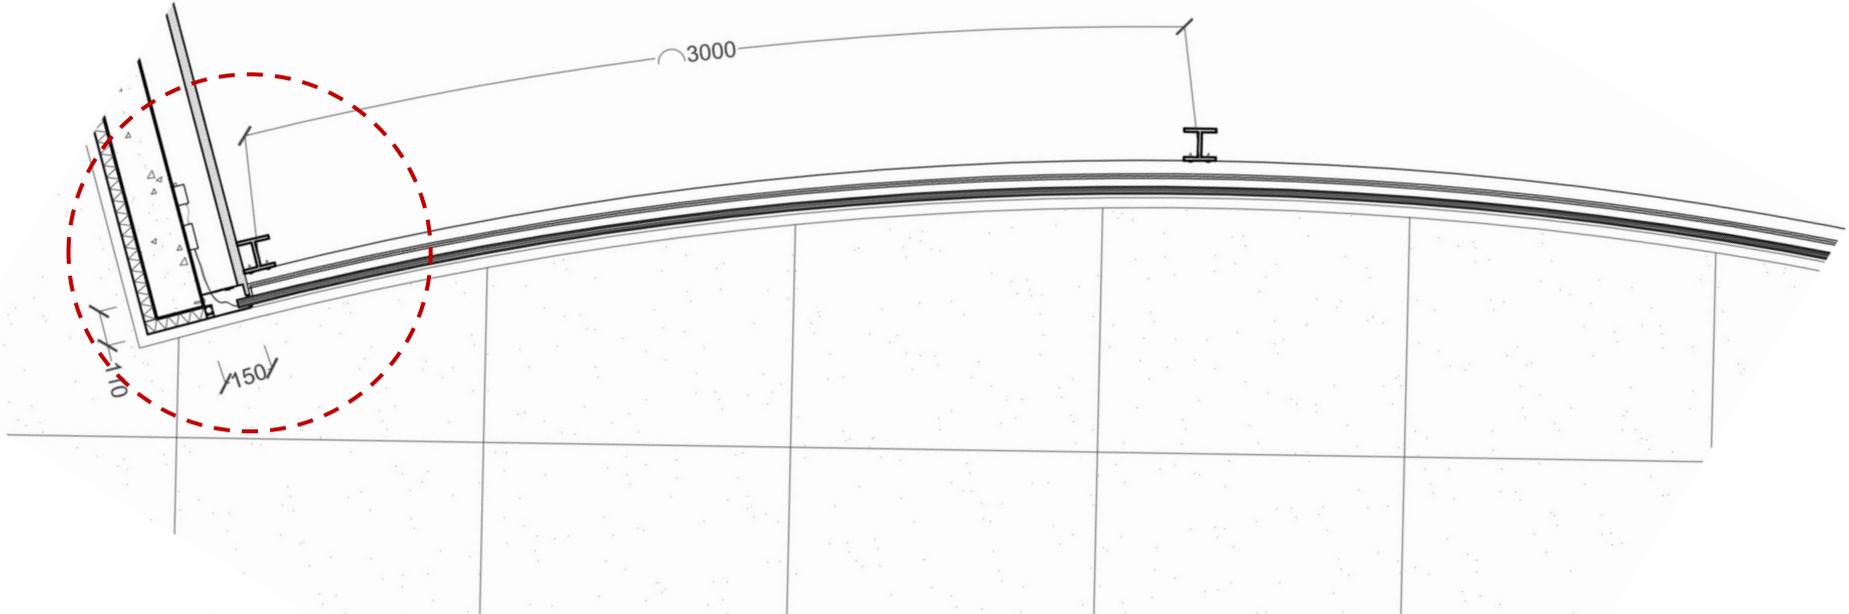

2nd design

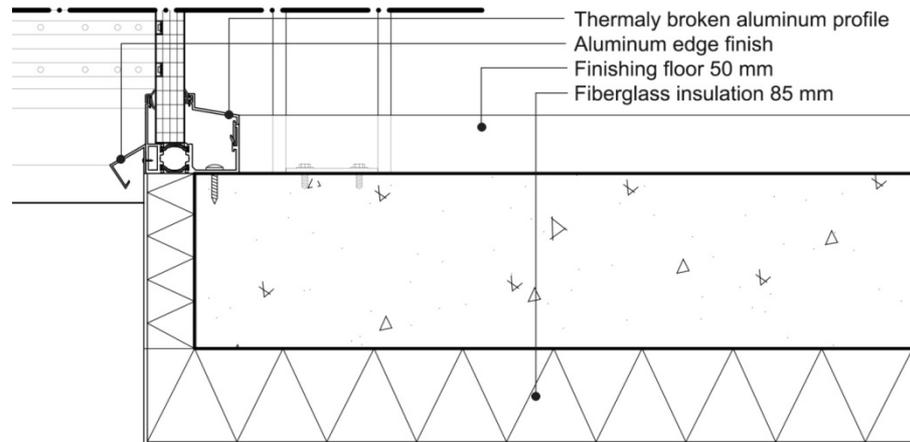

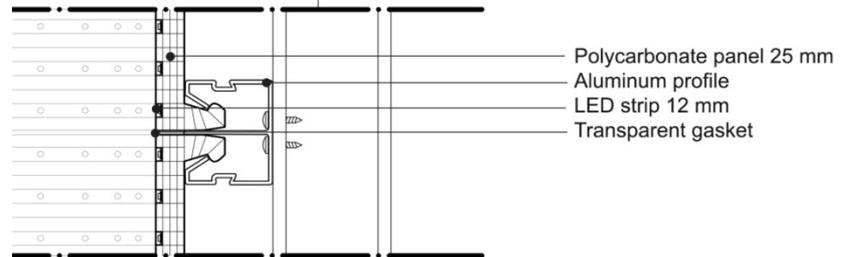

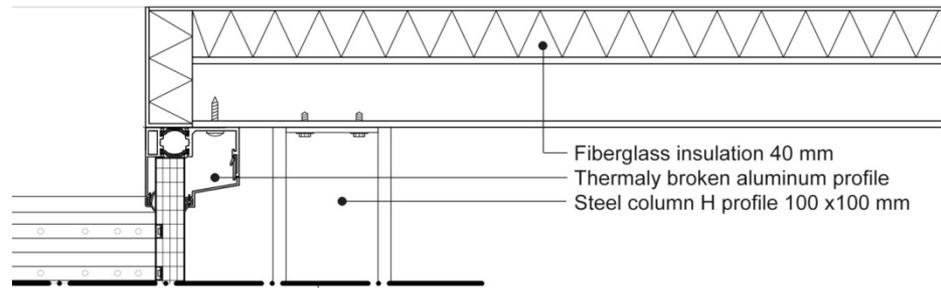

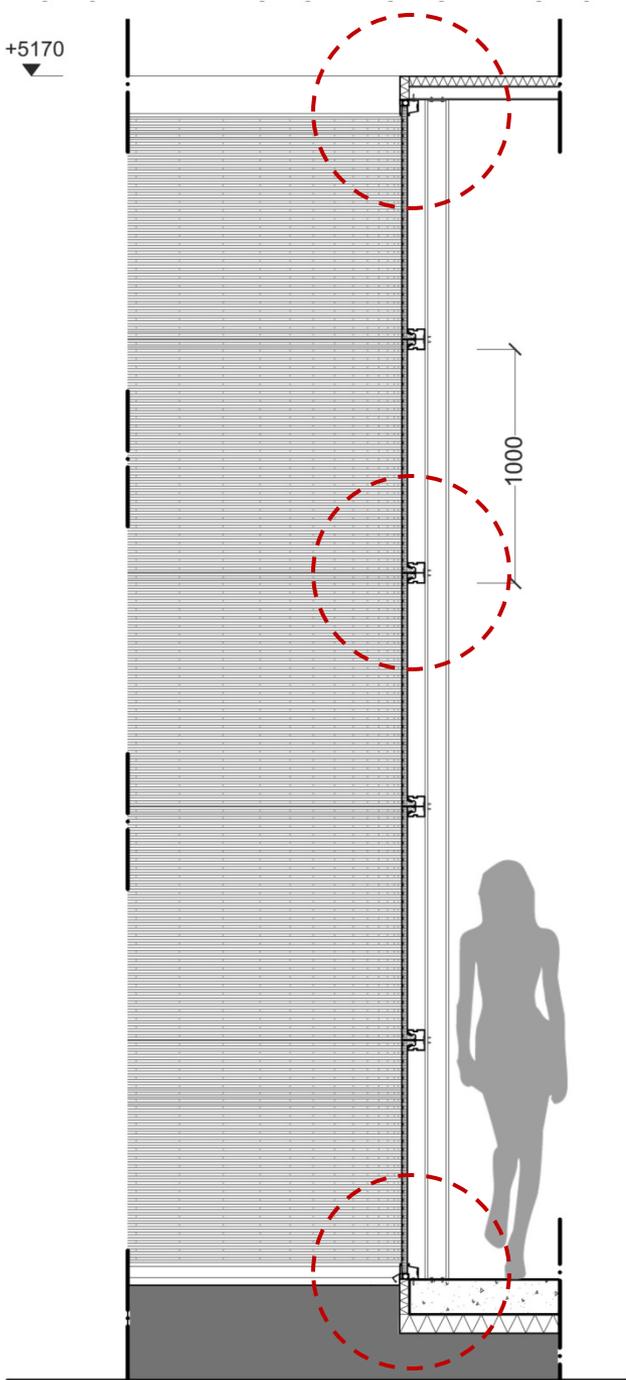

- 25 mm pixel pitch
- 22.400 nits
- Curved media facade for a public building 5 x 18 m
- 25mm thickness PCSS 1 x 18 m
- Example in Delft City Hall
- Grip locked system

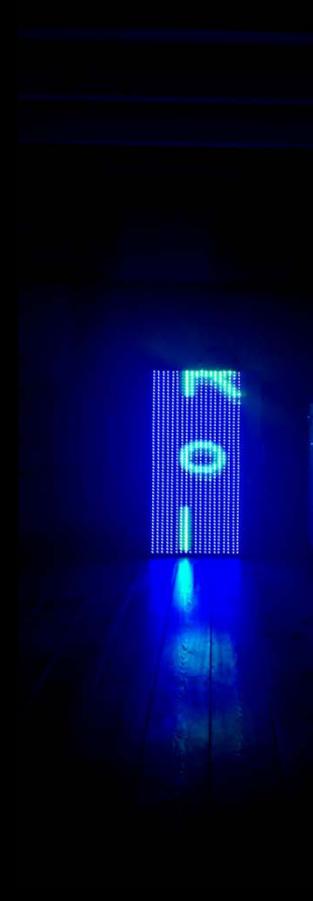

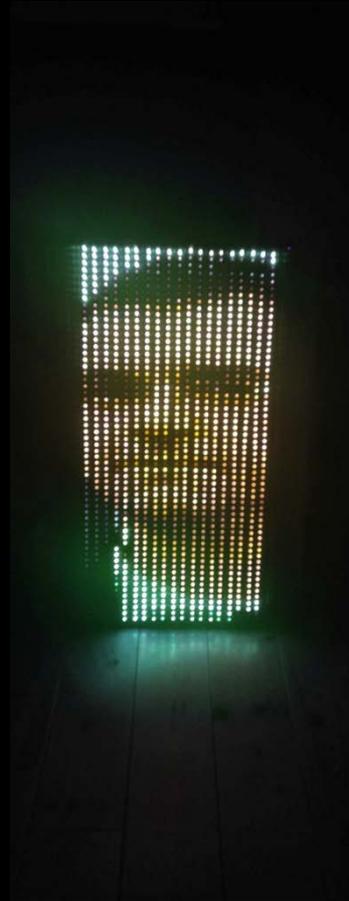

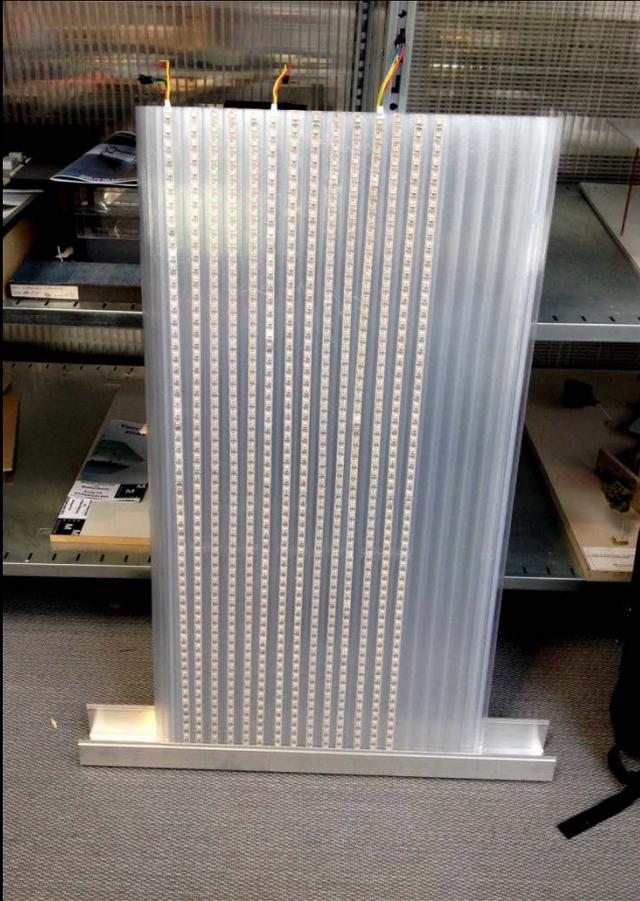

GRIP

+5170

Mock up

Minimum viewing distance needs to be higher than suggested by companies

Museum of energy Spain
25 mm pixel pitch from 30 m viewing distance-afternoon

Piccadilly Circus London
25 mm pixel pitch from 30 m viewing distance

BARCLAYS

pharmacy **Boots** beauty

GAP

Rollecate warehouse day
25 mm pixel pitch from 35 m viewing distance with direct sunlight

Rollecate warehouse night
25 mm pixel pitch from 35 m viewing distance

Evaluation +

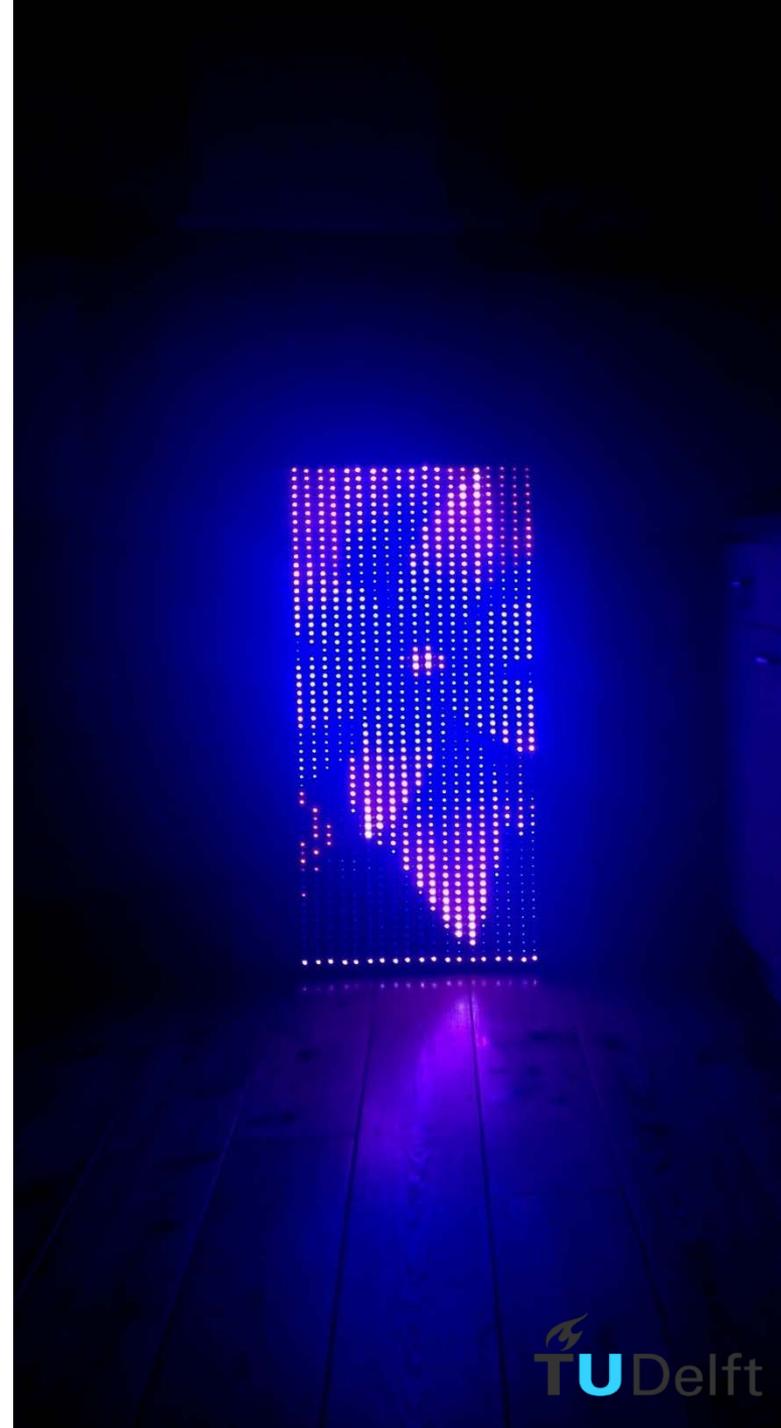

Initial standards

- **Light transmission** 72-50% but not 95% like glass
- **Good quality graphics** by easily adjusting pixel pitch variety >12 mm
- **Cost effective** solution (8 times cheaper than Philips and 35% less cost for a 25 mm than Brakel Atmos)-(10 and 8 times cheaper than GKD and Leurocom)
- **Maintenance** (LEDs are independent from PCSS, no lamination process or special enclosure)
- **Use in day and night** (above 50 mm pixel pitch sunlight affects the quality)

Evaluation

- **Limited life** of polycarbonate material and affected by the time (degradation and softening although the UV protection)
- Cannot be applicable in high rise buildings due to strong **wind loads** and pressures on the material
- Not applicable in **hot climates** in combination with the LEDs temperature emission
- **Sample** of 1:1 necessary and the distances increased

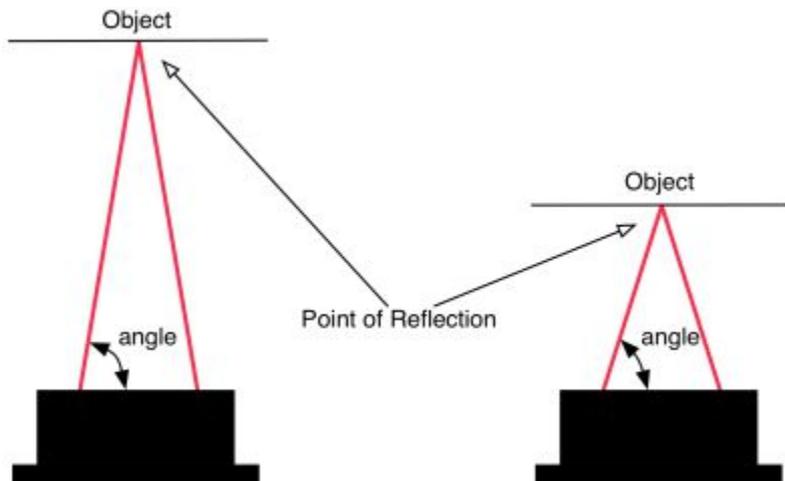

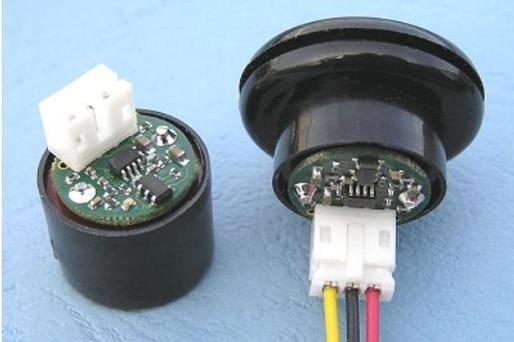

Further steps

- **Interactive LED facade using motion or pressure sensors (passing train)**

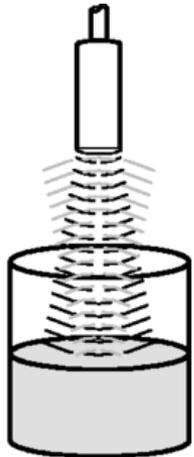

IR sensors(usually<1m)

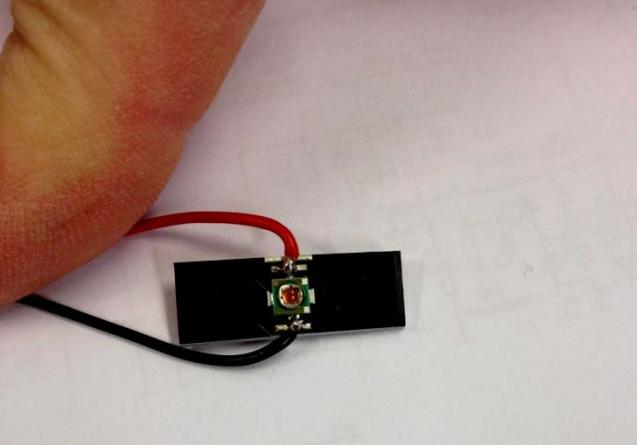

Two ultrasonic sensors are shown. The one on the left has a white connector, and the one on the right has a black connector. Both are mounted on a blue surface.

Ultrasonic sensors
6-10 m easily

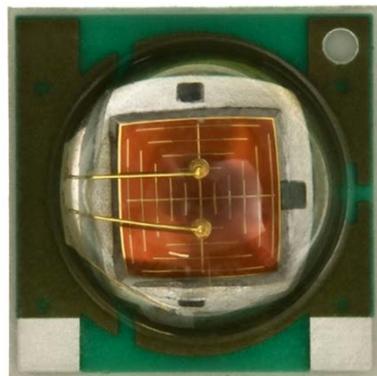

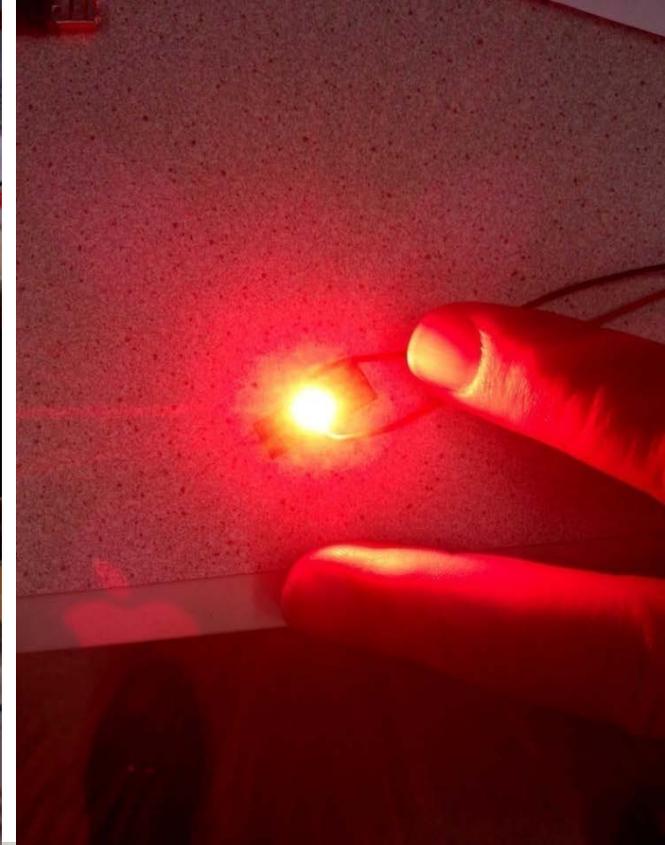

A diagram showing an ultrasonic sensor emitting waves towards a target. The sensor is labeled 'Sensor' and the target is labeled 'Target'. The waves are represented by a series of curved lines.

A diagram showing an ultrasonic sensor emitting waves towards a target. The sensor is a cylindrical device with a small protrusion on top. The waves are represented by a series of curved lines. The target is a cylindrical object with a flat top.

The logo for TU Delft, consisting of the letters 'TU' in a stylized font followed by the word 'Delft'.

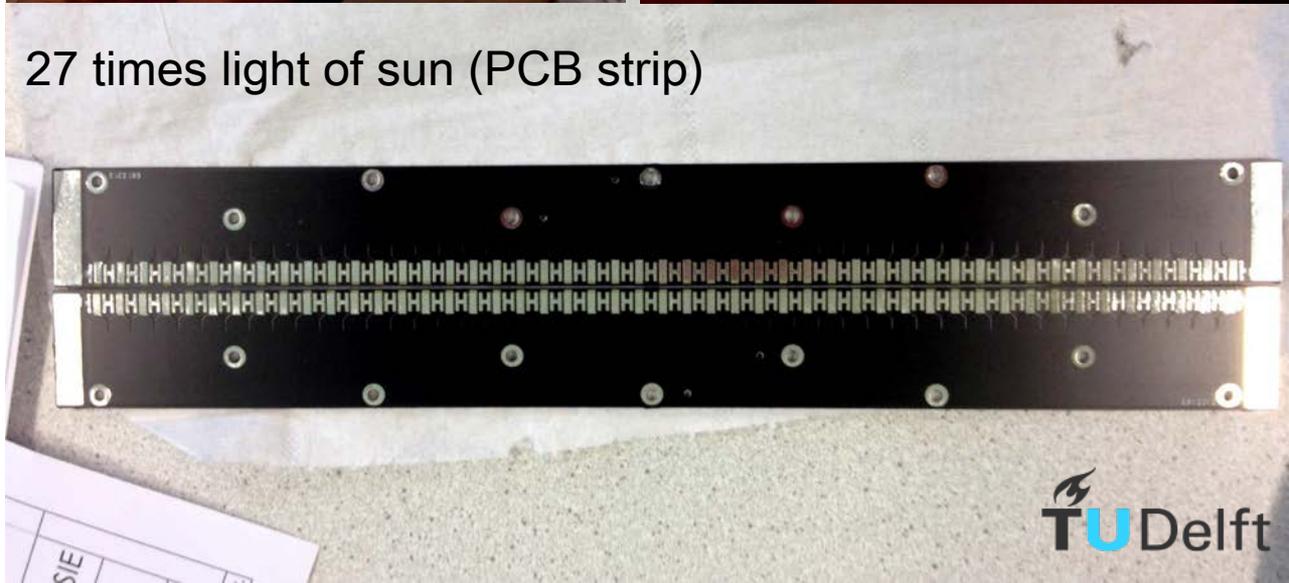

7 times light of sun(PCB)

XLamp® XP-e LeD

Possible application for better performance with direct sunlight in a media facade

27 times light of sun (PCB strip)

Future potential
