Fascination

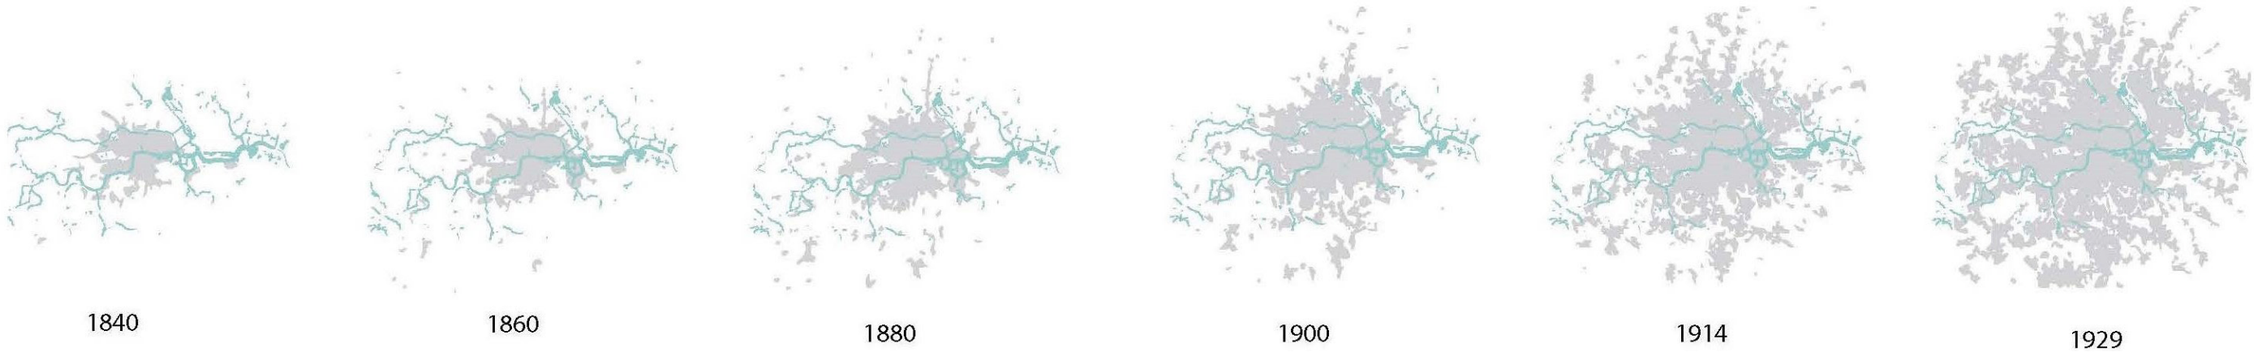

Food as a **social binding force**

Food is a **constant rhythm** in everyday lives.

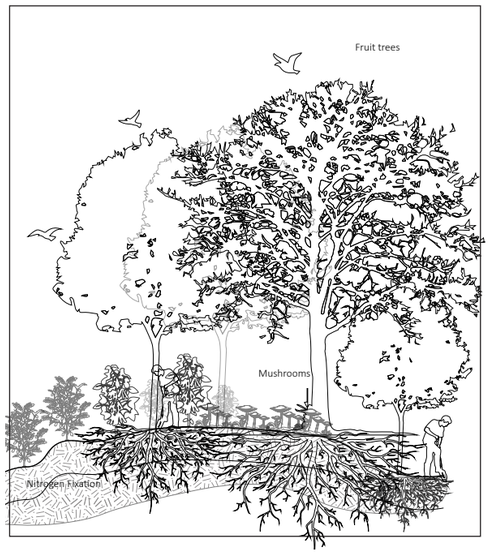

The feeding of cities has been arguably the greatest force shaping civilisation, and it still is.
In order to understand cities properly, we need to look at them through food.
- (Steel 2013, p. 10)

Potential of Food to transform

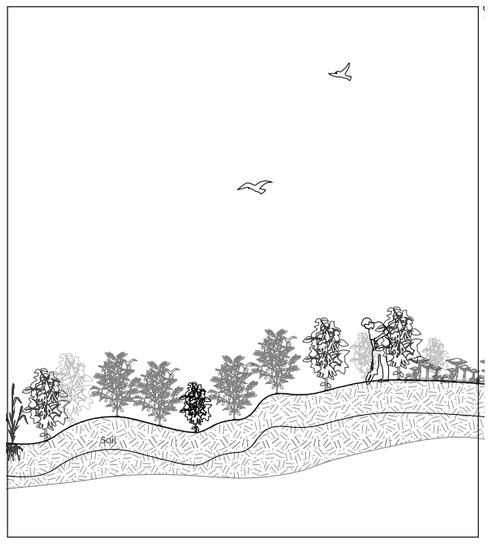

-cities
-Social spaces
-social relationships

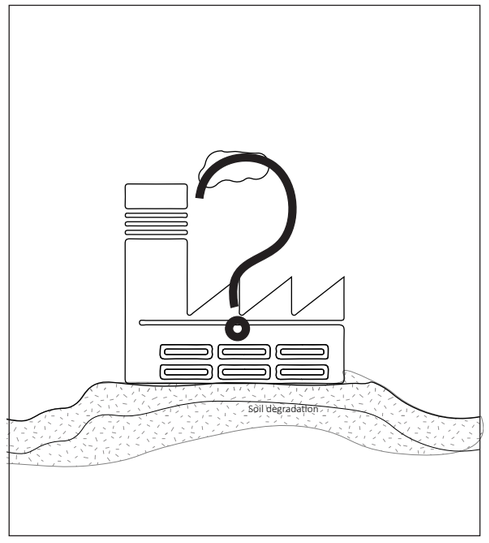

The simple laws of geometry meant that the larger a city grew, the smaller the relative size of its rural hinterland became, until the latter could no longer feed the former.
(Steel 2013, pp. 70–71)

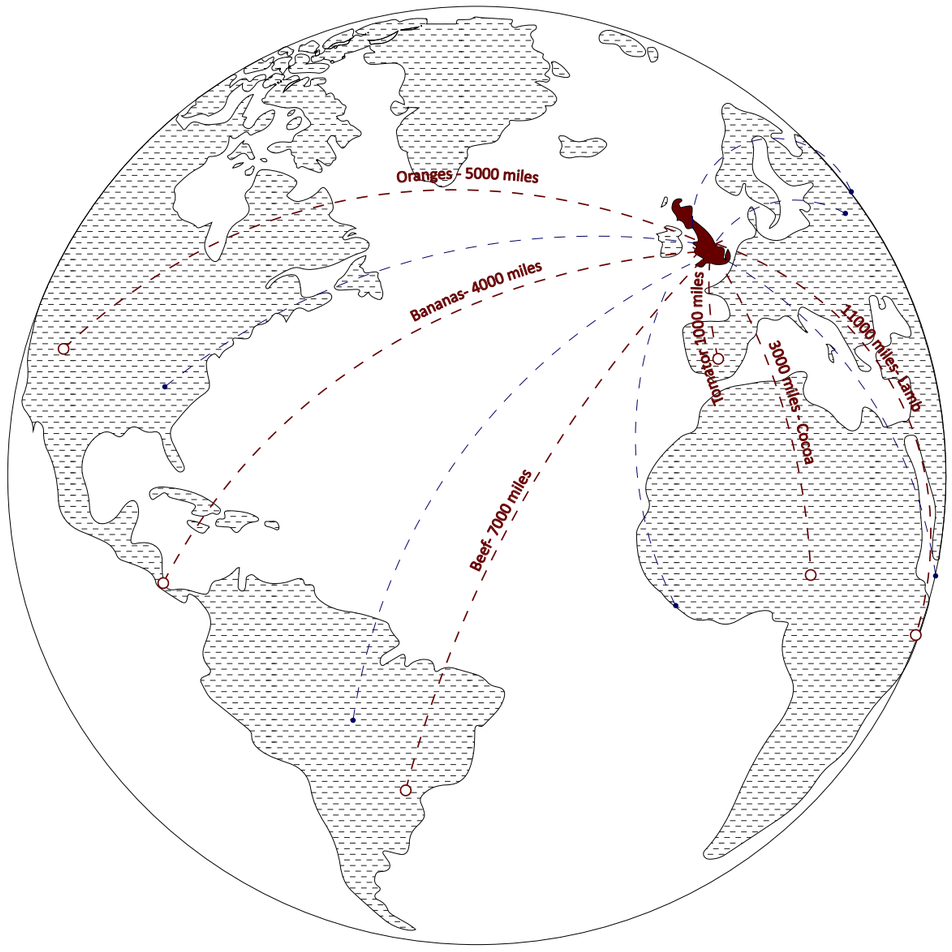

Pre - Industrial

Present

Post Anthropocene

From being self-sufficient within its rural hinterlands,London has transitioned to being reliant on an unsustainable global food network and agircultural practices.

Problem Statement

Communities have been held together by a fundamental infrastructure built on agriculture and food. Urban densification has obscured productive Landscapes and its networks paving way for increased food miles and an unsustainable agriculture practice. This disconnect has rendered the social fabric of the cities isolated and disintegrated.

Source

Consumer

The disconnect

Research Question/Agenda

How can architectural intervention **integrate productive landscapes** into the city to **restore the broken link between people and food** ,thereby bringing them **together socially?**

Production in and of an eco-social condition

- What are productive landscapes?
- What kind of mutation agriculture goes through when inserted into an urban context and what is the perception of value of land in urban context?
- What is the need to redevelop the social fabric of London and how do allotments and community gardens encourage the growth of interpersonal relationships among people involved?
- What patterns of spatial behavior can be induced by productive landscapes and where could it potentially be situated in London?
- How can the scales of various productive landscapes be merged to maximize the eco-social value of land and to serve more individuals so that it can compete with the uses that seek to eliminate it in exchange of commercial developments?

Potential of Food to transform **social relationships**

Modules

The design concept is rooted in the principle of modularity, where a grid system of 8 x 8 meters forms the basis for organizing the site. This grid system establishes three distinct modules of different scales: small, medium, and large, each serving specific functions.

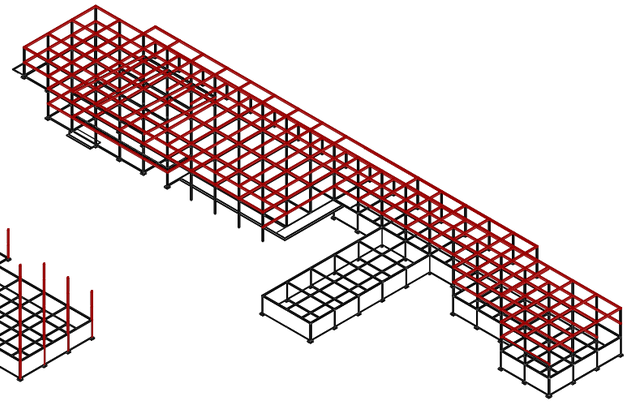

Modularity in Construction

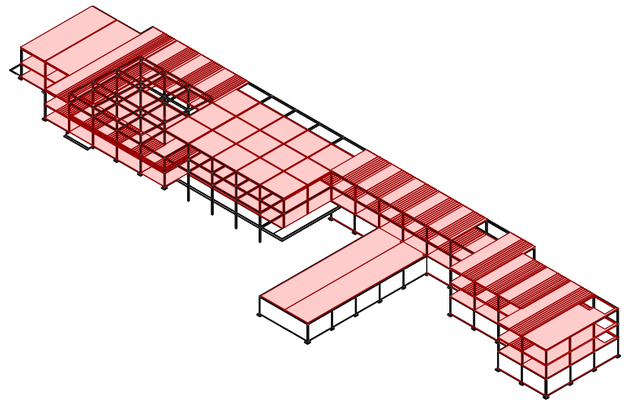

Pre cast Concrete Foundation Base

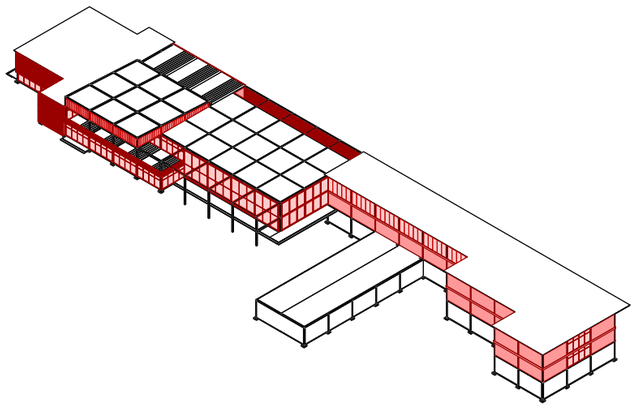

Timber Columns 300x300mm

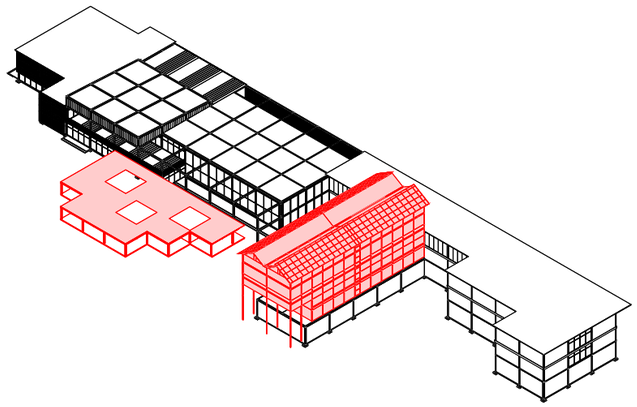

Glulam Beams 350 x 100mm

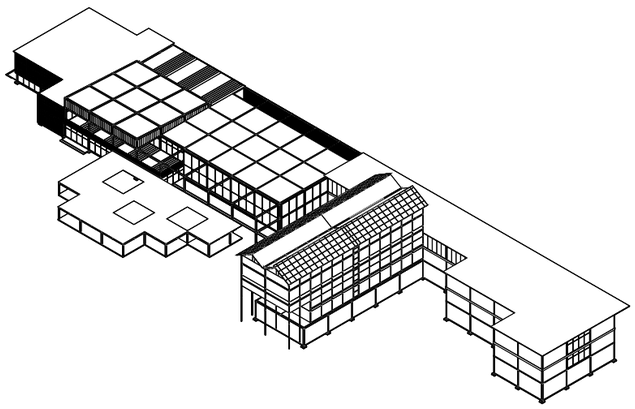

Wooden Flooring and Roof Structure

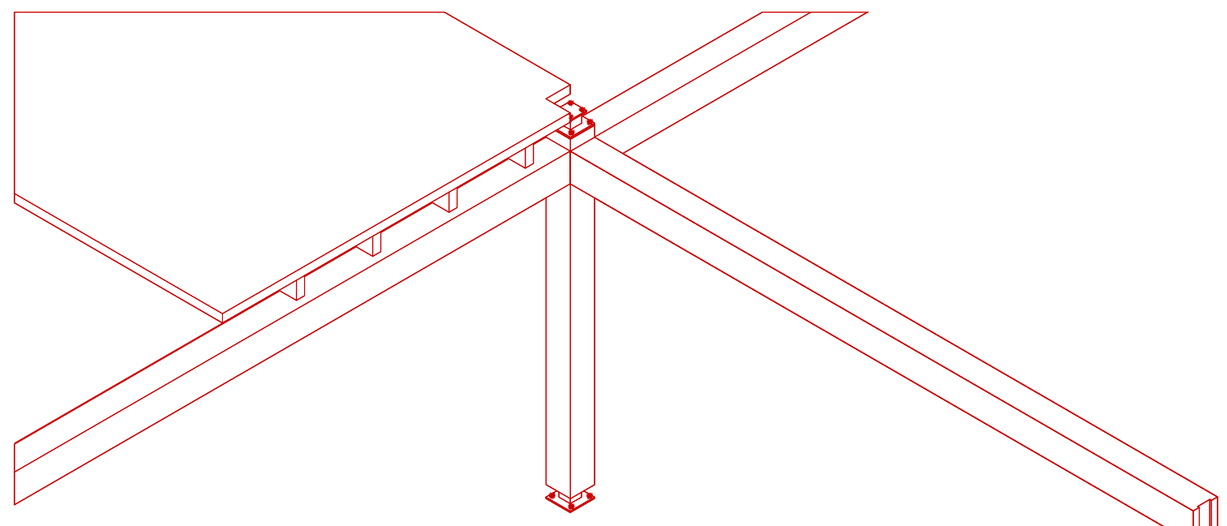

Facade slats and windows/ curtain walls

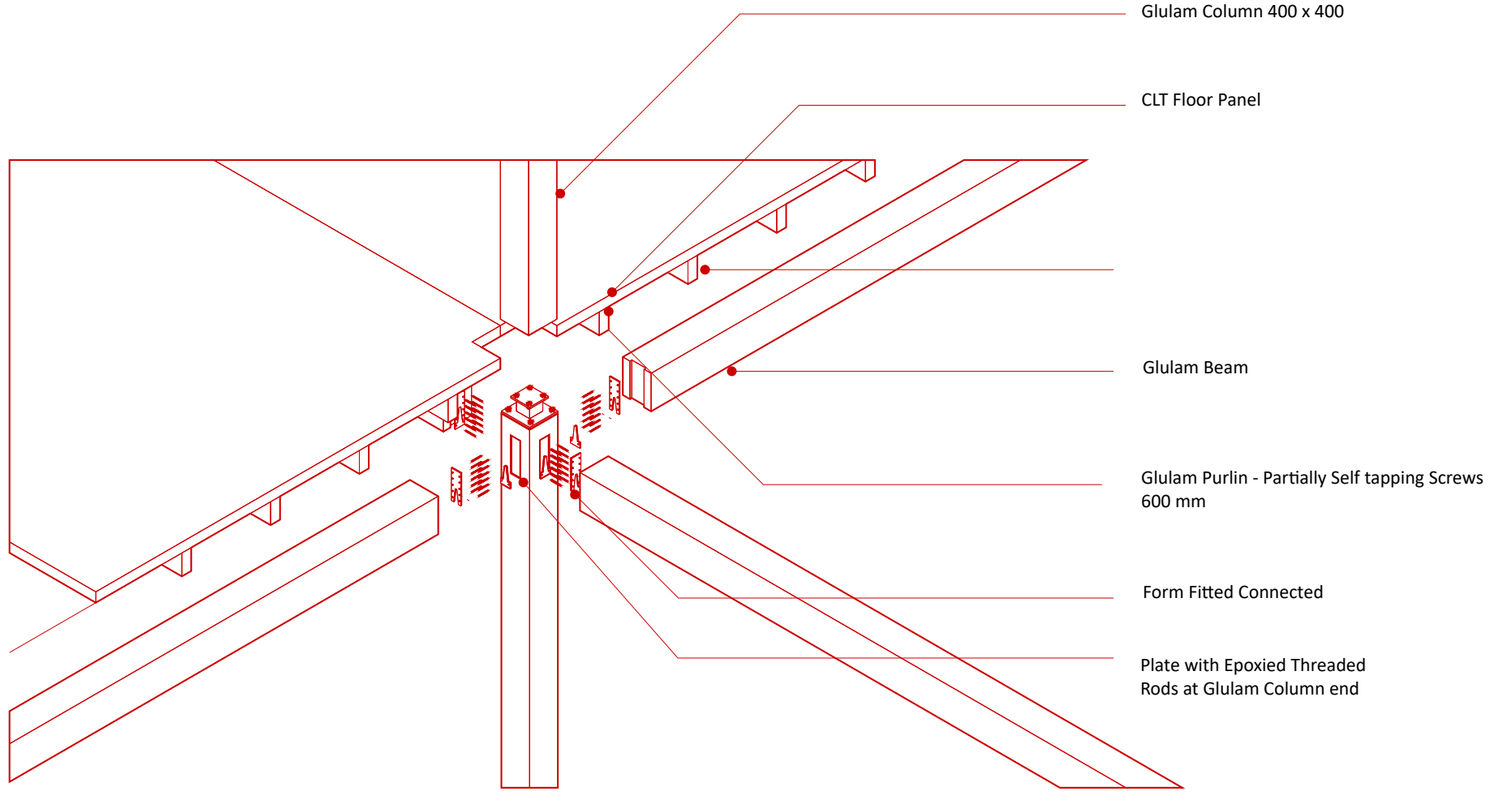

Attached Structure - Market and Vertical Farm
