## Factors influencing academic performance of real estate students in Nigeria

### 1. Introduction

Given that the need for quality education and training cannot be overemphasized, there is need to ensure that graduates can aptly fit into the dynamic global economy. As such, employers of labour are becoming desirous of graduates that will readily fit into their work-system and add value to firm. Thus, the globalization of businesses, driven by information technology as well as the advent of a knowledge based economy are important factors necessitating that graduates of institutions of higher learning are capable of responding to the changing demands of the market place and the real estate industry in particular. Meeting these contemporary needs of the industry however requires a thorough understanding of the courses that are taught in the universities. In other words, effective performance of the graduates in the industry can be related to their academic performance while in the University.

Real estate's academic curriculum is all-encompassing requiring students to audit and pass courses in economics, law and accounting, among others. Good performance in these courses by the students could be translated as the quality of knowledge and skills that will be available for use in the industry upon graduation. However, several factors such as course curriculum and content (Blundell, 1999; Newell and Eves, 2000; Yu Shin-Ming, 2001; Akinyemi, Ofem and Ikuenomore, 2012), learning environment (DeGregori, 2007; Frenzel, Pekrun and Goetz, 2007; Adedapo, Aderounmu and Aduwo, 2013), quality of training and the training process (Ditcher, 2000; Newell and Acheampong, 2003; Crews, 2004; Koulizos, 2006; Rangga, Ariffian, Norshishamuddin and Zarin, 2011) and socioeconomic background (Okioga, 2013; Kanagi et al, 2015) have been identified as potential contributors to the academic performance of students in higher institutions of learning. These factors often influence students' class of degree, quality of education received and the perception of graduates by industry employers.

Allen and Carter (2007) noted that both intellectual and non-intellectual factors serve as important predictors of students' level of academic achievement. Thus, students as recipients of the training process, not only play a major role especially at higher educational levels, the educational process cannot be said to be complete without them. The corollary of the foregoing is that, with increasing globalization, growing huge volume of investments linked to real estate assets and the investors' increasing level of sophistication, there is the need to have an insight into factors influencing the academic performance of real estate students'. This will help to ensure that real estate education remains relevant in an emerging economy like Nigeria.

1 The purpose of this paper is to examine the factors impacting on academic performance of real  
2 estate students in Nigeria. A study of this nature has important implication for both the  
3 universities offering real estate education and the stakeholders in the real estate industry, as it  
4 shows the perception of the students in relation to their socioeconomic and academic  
5 background. It is also important to relevant stakeholders as it provides them with necessary  
6 information on the factors that mostly impact on real estate students' academic performance.

## 11 **2. Review of relevant literature**

12 Several studies have investigated into factors influencing academic performance of real estate  
13 students. For instance Small and Karantonis (2001) underscored the importance of adequate  
14 practical training in real estate courses. The study of Newell and Acheampong (2003)  
15 investigated property education standards in Australia over a seven year period, by examining  
16 the perception of property graduates from seven universities in Australia over 1994 to 2001.  
17 Using survey conducted by Graduate Career Council of Australia, the study advocated  
18 improving the methodology adopted in teaching property degrees in Australia. Supporting the  
19 assertion of Small and Karantonis (2001), Callan and McCarthy's (2003) study surveyed final  
20 year students' and graduates of Biological and Biomedical Sciences in Massey University, New  
21 Zealand and industry employers. The result of the study showed that the graduates  
22 acknowledged the necessity for increased practical field work in their academic programme.  
23 Due to lack of professional real estate sales persons, Crews (2004) examined the effectiveness of  
24 real estate education and the need to create a learning environment that can meet the demand of  
25 adult students who do not have sufficient study time. The study concluded on the need for  
26 modern and adaptable mode of study for working class adults interested in pursuing a higher  
27 degree in real estate. Furthermore, the study of Boyd (2005) investigated the need to adapt  
28 current property education programme to suit the changing demands of real estate industry  
29 stakeholders. The author underscored the importance of an effective learning environment for  
30 the transfer of knowledge. The study further noted the increasing attention being placed on  
31 behavioural analysis and interdisciplinary skills through a re-examination of the existing body of  
32 knowledge and industry requirements.

50 Barry (2005) analysed the effect of factors such as peer influence, school and family on  
51 students' academic performance. Findings showed that socioeconomic status is one of the  
52 strongest predictors of students' academic performance. Hermino (2005) examined the factors  
53 influencing academic performance of first year accounting students in private and public  
54 universities in Puerto Rico. The findings revealed that internal classroom factors plays a major  
55 role in positively enhancing academic performance of students both private and public  
56  
57  
58  
59  
60

1 universities. Noble, Roberts and Sawyer (2006) investigated factors influencing students'  
2 performance on the American College Test. The authors noted that students' scores were  
3 directly affected by their past academic records at high school. However, family income,  
4 parents' educational level and negative situations at home influenced students' scores indirectly.  
5 Kyoshaba's (2009) study examined factors affecting undergraduate students' academic  
6 performance at Uganda Christian University. Findings from the study showed that there exists  
7 significant relationship between students' academic performance and A-level and Diploma  
8 admission points, parent's socio-economic status and former school background. However,  
9 there was no relationship between students' age and academic performance.  
10

11 The study of Kakulu and Plimmer (2009) analysed the balance between real estate education  
12 and practice in developing economies due to increasing globalisation. Following a comparative  
13 review of real estate education and practice in Nigeria and the UK, the study found that societal  
14 and cultural beliefs are gradually being incorporated into real estate education in Nigeria. The  
15 study concluded on the need to take cognisance of local employment market in the quest to  
16 internationalize real estate education. Bouillon and Carter (2009) investigated the level at which  
17 real estate courses influences real estate activities within the local market. The study affirmed  
18 the existence of a positive correlation between the number of real estate graduate courses and  
19 local real estate economy. Cornish, Reed and Wilkinson (2009) analyzed the usefulness of  
20 online technology as opposed to conventional classroom teaching and paper based assessment.  
21 The authors concluded that innovative technology ought to be embraced in the delivery of  
22 property courses in order to achieve efficiency and effectiveness. Hefferen and Ross (2010)  
23 examined factors compelling a change in real estate education and research in Australia. The  
24 authors concluded that professional bodies should assist universities in strategically positioning  
25 real estate education to meet up with changing demands. Victor (2011) evaluated factors  
26 impacting on academic performance of Biochemistry students at West Indies University.  
27 Amongst other influencing factors, the study found that age was an important determinant of  
28 students' academic performance as older students have difficulties with the course than younger  
29 students. Based on the premise that blended learning approach has more flexibility and it is  
30 believed to enhance learning outcomes, the study of Yam and Rossini (2012) compared the  
31 effectiveness of blended and online learning approaches, using first year undergraduates taking  
32 property valuation course. The study examined two study modes; the internal students exposed  
33 to the blended approach and external students exposed to only online approach. The study found  
34 that external students exposed to only online method performed better than internal students  
35 who adopted the blended mode of study.

1 Corroborating the finding of Newell and Acheampong (2003), Boyd's (2012) study examined  
2 the quality of the training process given to real estate students in Australia. The study  
3 recommended that lecturers and tutors should embrace innovative learning process. Hardin,  
4 Waller and Weeks (2012) analysing 102 universities offering real estate course, established  
5 benchmarks for real estate undergraduate course in the United States. The authors recommended  
6 the need for improved real estate education with greater focus on the demands of the immediate  
7 market and students. Okioga (2013) investigated the effect of socio-economic background on  
8 students' academic performance. The study analysed the views of 186 students in Kisii  
9 University College using analysis of variance, regression analysis and Likert scale. The author  
10 submitted that socio-economic background strongly influenced students' academic performance.  
11 Also, Dengra, Kalra and Malhotra (2013) analysed factors affecting students' academic  
12 performance. The study posited that extra-curricular activities, teaching methodology and class  
13 contact hours were important factors that determine academic achievements of students. While  
14 love relationships and lab facilities were identified as the least factors that impact on students'  
15 academic performance. Hayat *et al* (2013) examined factors affecting performance of topmost  
16 university students at the University of Agriculture and Institute of Management Science  
17 Peshawar. The results of the study showed that the level of students' involvement in their  
18 studies, quality of study, role conflict, relationship with fellows, and environmental indulgence  
19 were highly rated factors that would affect academic performance of topmost students enrolled  
20 at both universities. The study of Ganyaupfu (2013) investigated factors influencing academic  
21 performance of business students of private higher education in South Africa. The author noted  
22 that factors such as lecturer competence, teaching methods, and quality of learning had positive  
23 significant influence on students' academic performance. The study further submitted that  
24 mathematics aptitude and minimum admission requirements have no impact on students'  
25 performance.

26 Yeshimebrat, Alemayehu and Firew (2013) considered factors influencing female students'  
27 level of academic performance at Bahir Dar University in Ethiopia. The authors examined on  
28 and off campus factors such as personal related problem, university induced problems, academic  
29 and economic factors. The findings revealed that unconducive learning environment, peer  
30 influence, inadequate human and material resources and family background are major influences  
31 responsible for female students' low academic performance. Saginor, Weinstein and Worzala  
32 (2014) investigated the effect of the economic depression on graduate real estate programme.  
33 Using responses obtained from directors of graduate real estate programmes in the United  
34 States. Amongst other findings, the study revealed that there is an increase in competition from  
35 within universities, as more disciplines are hedging out real estate discipline in terms of ability

1 to attract students. Lee and Mallik (2015) investigated the effect of students' personal  
2 characteristics on academic achievement in a distance learning undergraduate real estate  
3 programme. Using a sample of 126 online graduates between 2007 and 2012, the study found  
4 that entry qualification and age contributed significantly to students' academic performance.  
5 Boyd's (2015) study reviewed previous researches on learning outcomes in Australian property  
6 education programmes. Kanagi *et al* (2015) analysed the effect of socioeconomic and academic  
7 background on academic performance of first year undergraduate students. Using cross-  
8 tabulation and multinomial logistic regression, the study showed that academic factors such as  
9 students' cumulative grade point average (CGPA) of entry qualification was an important  
10 determinant while socioeconomic factors such as gender and place of origin were considered  
11 less important factors contributing to students' academic performance. The study of Poon and  
12 Brownlow (2015) examined factors influencing real estate students' satisfaction in Australia and  
13 the effect of demographical variations on students' satisfaction. The study found that real estate  
14 students rated higher in their level of satisfaction when compared with other built environment  
15 students. The study further noted that students' age and mode of study impacted on the overall  
16 level of students' satisfaction.

29 While several studies have examined factors affecting students' performance in higher  
30 institutions of learning, there is however a dearth of studies examining the factors affecting  
31 academic performance of real estate students, especially from an emerging economy like  
32 Nigeria. Studies such as Oloyede and Adegoke (2007) examined the relevance of real estate  
33 curriculum and teaching techniques in Nigeria real estate practice. The study found that real  
34 estate graduates were deficient in areas of valuation, agency, feasibility and viability and  
35 property management. The authors suggested the need for computer based learning approach  
36 and a periodic review of teaching curriculum. Also, Gambo *et al* (2012) investigated the  
37 determinants of students' career choice of real estate as a field of study. Findings from the study  
38 showed that most students were fully informed about real estate as a course of study before  
39 admission. However, the authors suggested the need for increased career orientation for  
40 students' prior admission into the university. Udoekanem (2013) studied the perception of  
41 students towards the teaching and learning of plant and machinery valuation. The study showed  
42 that students understanding will be better enhanced through practical sessions as opposed to  
43 routine classroom lectures. The study recommended the need for the more field exercises and  
44 hands-on training for real estate students in Nigeria. Adedapo, Aderounmu and Aduwo (2013)  
45 investigated the perception of Architecture students to their learning environment and its  
46 influence on their academic performance. The study found that students' perception of the  
47 learning environment is related to the effectiveness of the teaching process. The recent study of

Oladokun and Ayodele (2015) assessed the relevance of Students Industrial Work Experience Scheme (SIWES) to real estate education in Nigeria. The study concluded that while SIWES helps real estate students acquire experience in private practice, it also enables them acquire requisite behavioral skills. Related skills of this nature are observed in real estate marketing assignment of firms which are determined by the knowledge base of the graduates from the tertiary institutions to the industry (Sani and Gbadegesin, 2015).

From the review of literature, factors impacting on academic performance can be grouped into six broad categories- parental and family background (Noble *et al*, 2006; Kanagi *et al* 2015; Kyoshaba 2009; Okoiga, 2013), students personal factors (Kanagi *et al*, 2015; Victor, 2011; Hayat *et al*, 2013; Dengra *et al*, 2013), school and academic environment (Yeshmerbat *et al*, 2013; Adedapo *et al*, 2013; Hermino, 2005), teaching techniques/methods (Udoekanem, 2013; Callan and McCarthy, 2003; Dengra *et al*, 2013; Small and Karantonis 2001), lecturers (Ganyaupfu, 2013; Dengra *et al*, 2013; Newell and Archeampong, 2003) and mode of assessment (Crews 2004). However, the perspective of real estate students especially from an emerging country like Nigeria, where issues and implications of socioeconomic variations, learning environment, economic influences and viable career choices are of paramount importance, the factors influencing real estate students' academic performance might pose different results. Thus, this study seeks to complement literature by examining the academic performance of real estate students' in Africa's emerging economy, with particular reference to Nigeria.

### 3. Research method and data

The study population for the paper included two tertiary institutions; Obafemi Awolowo University, Ile-Ife and Federal University of Technology, Akure, both in South-western Nigeria. The sample frame included final year real estate students in these Universities. The choice of the final year students is based on the notion that they have spent ample time in the university and their level of perception might better reflect the actual realities of factors influencing real estate students' academic performance. Thus, their level of academic experience and judgment could be considered higher in comparison to other lower levels. Responses were obtained through self-administered close-ended questionnaire. While a total of one hundred and fifty two (152) questionnaire were administered, only one hundred and twenty seven (127) were retrieved for analysis. This represents 83.5% response rate.

The questionnaire was structured into two sections. The first section asked questions about the socioeconomic and academic background of the respondents. The section contained items such as age, gender, marital status, family size and background, mode of admission, monthly

allowance, how they got to know about real estate, influence of family set up on performance, what influenced the decision to study real estate, whether their academic performance might have been better if admitted to their preferred course of study and so on. These, amongst other issues, were considered.

The second section obtained responses about the perception of students on factors affecting their academic performance. In examining the factors contributing to real estate students' academic performance, list of identified factors from literature were grouped into six (6) sub-sections. The first subsection is on parental and family background, the second focused on students personal factors, while school and academic environment, teaching techniques/methods, lecturers and mode of assessment were listed in subsections three (3) to six (6) respectively. Lists of factors were identified under each subsection and the students were asked to rank how these factors affect their academic performance. Ranking was done on a 7-point Likert scale of 1 - strongly disagree to 7 – strongly agree.

Data collected were analyzed using descriptive and inferential statistical tools. Descriptive statistical methods (frequency distribution, percentages and cross tabulation) were employed in analysing students socioeconomic and academic background while mean rating was used to rank the factors influencing students academic performance. The mean of each item in the subsection was used in ranking the items, while the mean response for each subsection was obtained and used as a benchmark against the individual item mean for items in the subsection. This was used to determine the important items under each subsection. Furthermore, the identified factors were subjected to factor analysis to identify components that impacted more on students' academic performance.

#### 4. Research findings and discussions

In presenting the results of the study, the paper first examined the socioeconomic and academic characteristics of the respondents. Subsequently, the paper analysed the perception of the students with respect to factors contributing to their academic performance. The results of the analysis are presented in Tables I-VII.

##### 4.1 Socio-economic background of respondents

Table I. Socio-economic background of Real Estate Students

\*Exchange rate of NGN ₦197.5 to USD \$1 as at February 2015

Analysis of responses from Table I showed that majority of the students (63.8%) were below 24 years of age. While 29.9% of the respondents were between 25-30 years old, the remaining 3.1% were above 30 years. This suggests that most of the students gained admission quite at an early age to study real estate; given that most students possibly gained admission at an average of 18 to 19 years. The gender distribution of the students indicated that 55.1% are males and 44.9% are females. This perhaps is due to the perceived notion that the profession is male dominated as only few females are prominent in the real estate industry either as practitioners or academics. Responses in respect of the marital status of the respondents showed that 92.9% were single while 6.3% were married.

The analysis of the family background showed that most respondents (85.8%) were from monogamous families while 12.6% were from polygamous families. This might be due to the increasing infiltration of the Western culture of monogamy and perhaps reinforced by religious beliefs. Furthermore, while 68.5% of the respondents had their parents living together, 21.3% had their parents living separately, perhaps due to the exigency of their work or as a result of other economic or personal reasons. 4.7% of the respondents were orphans and 0.8% had their parents divorced or living as single parents. These suggest that most of the students were from a relatively stable home in terms of family background and type of parenting. Thus, it should be expected that the students should apparently not have family distractions. Also, responses on the family size showed that most of the students (59.8%) were from a seemingly modest family size of 5-7 (parents inclusive) given the perception of most African cultures to child bearing and procreation, while 11.8% and 3.1% indicated a family size of 8 to 10 and above ten persons respectively. Since the importance of the family unit cannot be overemphasized, the evidences from the responses suggest that most of the respondents were from family setup that should positively impact on their academic performances. This was evidently depicted in the responses as 78.7% of the students indicated that their family setup and background had positive influence on their academic performance, while 20.5% of respondents were indifferent and 0.8% responded in the negative.

With respect to the students finances 14.2% of the students lived on less than USD\$ 26.00 per month, 41.7% of the students had between USD\$ 26-51 while only 12.6% had a monthly stipend of above USD\$ 102.00. This apparently suggests that most students lived on less than

USD \$1 a day, as such the students might not be financially sufficient and might have to manage the meagre allowances available to them while trying to get the best from their academics. Perhaps as a result the monogamous nature of the students' family, responses showed that 54.3% of the students had their finances solely from their parents, 8.7% solely from relatives. 26% got from both relatives and parents while 6.3% are self-financed. Responses regarding students' extracurricular activities showed that 39.4% of the students often engage in extracurricular activities while 38.6% sometimes engaged in extracurricular activities. The remaining 19.7% rarely engaged in extracurricular activities. This shows that most of the students were often engaged in other activities such as religious, sporting and other recreational activities.

Table II. Cross tabulation of marital status with gender and age

			Marital Status				
			Single	Married	Others	Total	
Gender	Male	Frequency	67	3	0	70

Further examination of the effects of gender and age of students' academic performance, A further analysis of the respondents marital status was done by cross tabulating the responses from the marital status with gender and age as shown in Table II. This revealed that out of the eight (8) married respondents three (37.5%) were males and five (62.5%) were females. This showed that more females got married during the course of studying for their first degree. While seven (87.5%) of the married students were between 25-30 years, only one (12.5%) was 24 years below. This suggests that most of the married students perhaps decided to get married because of the age factor. However, with respect to the students' academic performance, the marital demands could possibly be a factor to be considered. It is expected that while maintaining a balance between the marital needs and academic schedule, there might be some trade-offs that might likely impact both on the students' academics and possibly their homes.

#### 4.2 Academic background of respondents

Table III. Academic background of Real Estate Students

	Frequency	Percentage
<i>Secondary School Background</i>		
Commercial	28	22
Art	11	8.7
Sciences	88	69.3
<i>Knowledge about Real Estate</i>		
Through the media	7	5.5
Career Talk	7	5.5
Through Relatives	24	18.9
From Friends	12	9.4
During Admission Process	77	60.6
<i>What Influenced respondent in studying Real Estate</i>		
Friends	9	7.1
Relatives	16	12.6
Personal Interest	42	33.1
Parental Influence	8	6.6
Inability to get desired course	46	36.2
Others	6	4.7
<i>Mode of Admission</i>		
Pre-Degree	49	38.6
UTME	54	42.5
Direct Entry	22	17.3
No response	2	1.6
<i>Study hours</i>		
at most 3 hours	6	4.7
4-6 hours	86	67.7
Above 6 hours	35	27.6
<i>Performance if given preferred course of study</i>		
Most likely perform better	49	38.6
Quite unlikely perform better	10	7.9
No difference in performance	37	29.1
Not sure of what my performance would be	31	24.4

Analysis of responses from Table III relating to real estate students' academic background showed that most of the respondents (88%) had Science background while 28% and 11% had Commercial and Arts background respectively during their secondary school training. This suggests that only few students had Arts background, and perhaps were given real estate as an alternative course of study during the admission process. The analysis also showed that 60.6% of the students got to know about real estate as a discipline during the admission process, 9.4% from friends, while 18.9% had prior knowledge of the course through their relatives. Those that had the knowledge of real estate through career talk and the media were 5.5% each. This

suggests that though most of the students got informed about the course through their relatives and friends, the discipline is not having sufficient publicity through the media and career services to stimulate the interest of secondary school students in pursuing a career in real estate. Though the lack of students' interest in real estate discipline might also be attributable to the failure of the professional body to effectively promote the discipline at secondary school level, it might be further compounded by the general perception of secondary school students that medical and engineering courses are more lucrative, thus undermining the possibility of taking up a career in real estate. Besides, 36.2% of the students decided to study real estate due to their inability to get the desired course of study, 33.1% enrolled for the course based on personal interest, while 12.6% and 7.1% were influenced through their relatives and friends respectively. Other responses indicated that 6.6% were advised by their parents to enrol for the course. This perhaps further substantiates the previous finding that most students were not aware or interested in real estate as a course of study prior their admission into the university. Apparently, due to the lack of interest at the initial point of admission, academic performance of students might not be as excellent as it would have been if the students were given their preferred course of study.

The students were subsequently asked about their likely performance if offered their preferred course of study. The responses showed that 38.6% of the students believed that they will most likely perform better than their current academic performance, 29.1% responded that there might be no difference in their academic performance, while 24.4% were not sure of what their performance would be if given their preferred course of study. Responses regarding the students study hour showed that 67.7% of them studied for about 4-6 hours daily, while 4.7% studied for not more than 3 hours, while 27.6% studied for above 6 hours. This indicates that most of the students devote reasonable amount of time to their studies in the pursuit of better academic performance. Underlying factors such as the cumbersome nature of the programme and the fact that most of the students got to study real estate as an alternate course might be responsible for the reason while some of the students do not consider having more study hours.

Table IV. Cross tabulation of knowledge of real estate and what influenced studying real estate

		Friends	Relatives	Personal interest	Parental influence	Inability to get desired course	Others	Total
Through the media	Frequency	1	1	5	0	0	0	7
	Percentage (%)	14.3	14.3	71.4	0	0	0	

1	Career talk	Frequency	0	2	4	0	0	1	7
2		Percentage (%)	0	28.6	57.1	0	0	14.3	
3	Through relative	Frequency	0	9	9	4	2	0	24
4		Percentage (%)	0	37.5	37.5	16.7	8.3	0	
5	From friends	Frequency	6	0	5	0	1	0	12
6		Percentage (%)	50	0	41.7	0	8.3	0	
7	During admission process	Frequency	2	4	19	4	43	5	77
8		Percentage (%)	2.6	5.2	24.7	5.2	55.8	6.5	
9	Total		9	16	42	8	46	6	127

A further analysis by cross tabulating how the students got to know about real estate as a course of study and what influenced the students choice of real estate discipline as shown in Table IV showed that out of those that got to know about real estate during the admission process, 55.8% of them decided to study real estate due to their inability to get the desired course of study, while 24.7% decided to accept the course due to personal interest after being offered the course as a result of their inability to get the desired course of study.

### 4.3 Factors influencing students' academic performance

#### 4.3.1 Mean ranking of influencing factors

Table V shows the mean standard deviation, mode as well as aggregate ranking of respondents' perception of factors influencing real estate students' academic performance.

Table V. Factors influencing students' academic performance

S/N	FACTORS	MEAN	SD	MODE	RANK
<i>Parental and Family Background</i>					
1	Parents interest in my academics	3.98	1.95	4	5
2	Parent's occupation and level of education	4.06	2.03	6	4
3	My position and family size	5.82	1.50	7	1
4	Availability of Finances	4.78	1.84	6	3
5	Family pressure to excel in the field of study	3.20	1.87	2	6
6	Family background/set-up	4.94	1.92	7	2
		<b>4.46</b>			
<i>Personal Factors</i>					
7	Unavailability of preferred course of study	3.33	2.12	1	6
8	Maturity/Age	4.35	2.06	7	2
9	Difficulty in understanding the courses being taught	3.93	1.88	2	3
10	Study hours	3.17	1.71	2	7
11	Clear understanding of the field of study	3.93	1.80	4	3
12	Personal interest in the course of study	5.00	1.64	6	1
13	Involvement in extra-curricular activities	3.41	1.89	2	5
		<b>3.87</b>			
<i>School and Academic Environment</i>					
14	School's academic calendar	4.36	1.71	3	1

15	Accommodation type	4.06	1.96	5	2
16	Conducive lecture theaters	2.54	1.56	1	4
17	Adequate lecture theaters	2.47	1.49	1	5
18	School's general environment	3.97	1.80	5	3
		<b>3.48</b>			
<i>Teaching Techniques</i>					
19	Use of ICT methods in teaching	2.62	1.71	1	5
20	Students' participation in class	4.71	1.58	5	1
21	Tutorials and workshops	3.39	1.83	1	3
22	Field trips	3.18	1.74	1	4
23	Contact hours	4.49	1.64	5	2
24	Use of practical and less of theories	2.52	1.66	1	6
		<b>3.49</b>			
<i>Lecturers</i>					
25	Lecturers knowledge and depth	4.09	1.70	3	5
26	Lecturers being accessible	3.96	1.74	3	3
27	Commitment of the lecturers	4.83	1.57	5	2
28	Ability of lecturers to explain difficult concepts	4.03	1.64	5	4
29	Sufficiency/adequacy of lecturers	4.20	1.72	3	6
30	Mode/method of teaching	4.86	1.51	5	1
		<b>4.33</b>			
<i>Mode of Assessment</i>					
31	Fairness in class assessments	4.88	1.70	7	3
32	Efforts put in preparation being reflected by the grades	5.74	1.43	7	1
33	Adequate study materials	4.10	1.74	3	5
34	Sufficient time to understand and assimilate before being assessed	4.13	1.73	5	4
35	The lecturers seem to be more interested in testing what I had memorized than what I truly understood of this field of study	5.39	1.65	7	2
		<b>4.84</b>			

From the analysis, the first subsection on parental and family background had an average of 4.46. Using this as a benchmark for the subsection, major factors having mean values above the benchmark include students' position and family size with a mean value of 5.82, availability of finances and family background/setup with mean values of 4.78 and 4.94 respectively. Most of the students agreed that their position and family size enhance their academic performance. This could be as result of the students' socioeconomic background where most (85.8%) are from monogamous homes and majority of the students' are also from family size of not more than seven (7) persons. This could also be attributable to the fact that most of the students' (68.5%) have their parents living together. This underscores the importance of the family background as an integral part of students' academic success. The third most important factor identified in the subsection is availability of finances. This is apparently evident as most of the students (55.9%)

1 live on less than USD\$ 2.00 per day (USD\$ 51.00 per month) and most of them depend solely  
2 on parents for their monthly stipend. This perhaps underscore the need for institutions of higher  
3 learning especially in developing countries to initiate a more robust work study initiative for  
4 financially challenged students with the aim of improving their academic performance and  
5 compete favourably with their counterparts globally.  
6  
7  
8  
9

10 Findings from the second subsection on students' personal factors with a mean benchmark of  
11 3.87 showed that the students' interest in real estate as a field of study (5.00), age and maturity  
12 (4.35) are major factors affecting students' academic performance. Given that 81% of the  
13 students are age 24 and below, it is expected that they are mature to decide on issues pertaining  
14 to their lifestyles and reading habits. Also, perhaps because most of the students were offered  
15 real estate as an alternative course to their desired course of study, the students identified lack of  
16 clear understanding of the field of study and difficulties in understanding the courses as factors  
17 influencing their academic performance. These two factors had mean values of 3.93 each.  
18  
19  
20  
21  
22  
23

24 The third subsection on school and academic environment had a subsection mean of 3.48, while  
25 the topmost factors based on the benchmark mean value are school's academic calendar (4.36),  
26 accommodation type (4.06) and school's general environment (3.97). The prevalence of  
27 students' unrest and incessant interruption of academic calendar due to activities of academic  
28 and non-academic unions portends a serious negative effect for the academic performance of  
29 students in tertiary institutions. This most times result in shortening/compression of academic  
30 calendar and consequently there might not be adequate time to attend to some academic  
31 necessities that might have improved the learning experience of real estate students in these  
32 institutions. Also, overcrowding and stretching of existing hostel facilities could hamper on  
33 students effectiveness. The pattern of responses showed that most of the students perceive that  
34 the school academic calendar, accommodation type and school's general environment impact  
35 more on their performance than the lecture rooms in terms of adequacy and conduciveness. This  
36 pattern of response seems to go contrary to conventional perspective where it is expected that  
37 the lecture room should have substantial impact of student academic performance, as opposed to  
38 school's general environment. However, the reason for this might not be farfetched, perhaps the  
39 students were of the opinion that any venue where lecturer-student interaction can take place  
40 might just be good enough, thereby deemphasizing the impact of adequate and conducive  
41 lecture venues.  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54

55 The subsection on teaching techniques having a mean value of 3.49 showed that the students  
56 identified class participation and contact hours, each with mean values of 4.71 and 4.49  
57 respectively, as factors influencing their academic performance. This apparently suggests that  
58  
59  
60

1 the students believe that learning through class discussion/interactive sessions and sufficient  
2 contact periods would have major impact in positively influencing their academic performance.  
3 With a mean value of 4.33, the subsection on lecturers' revealed that commitment of lecturers'  
4 (4.83) and mode/method of teaching (4.86) as the topmost two factors based on the subsection  
5 mean value. The responses might be linked to the fact that the students believe that with high  
6 level of commitment from the lecturers and enhanced mode/method of lecture delivery,  
7 knowledge would be better impacted, thus resulting into better academic performance. The  
8 subsection on mode of assessment had a mean of 4.84. The responses showed that fairness in  
9 class assessment (4.88), grades reflecting students' level of preparation (5.74) and lecturers  
10 being interested in memorizing as opposed to understanding (5.39) were ranked as top factors.  
11 This indicates that the students believed that their academic performances could be better  
12 enhanced when hours spent studying and efforts put into preparation are justified by good grade  
13 points, and lecturers are less interested in regurgitating answers as opposed to students  
14 understanding of the course.  
15

16 Examining the mean values of the subsections showed that the subsection on mode of  
17 assessment had the highest mean value of 4.84, followed by the sub section on parent and family  
18 background with a mean value of 4.46. While the sub sections on lecturers, students personal  
19 factors, teaching methods and techniques and school and academic environment each with mean  
20 values of 4.33, 3.87. 3.49 and 3.48 respectively. This shows that issues bothering on academic  
21 assessment and parent and family background are the topmost two ranked subsections affecting  
22 the students' academic performance. While teaching methods and techniques and school and  
23 academic environment are the least two ranked subsections impacting on students' academic  
24 performance. This perhaps shows that the students might be better encouraged when results  
25 obtained conform to their expectations. Though this might be difficult to achieve as most  
26 student often have false impressions of their performance during class assessments, however,  
27 openness regarding the basis and methods of assessment may assuage students' misgivings and  
28 help them perform better in subsequent assessments. Also, given the importance of parent and  
29 family background, the responses underscore the fact that stability in the homes and provision of  
30 adequate financial resources to meet the academic demands of students could go a long way in  
31 ensuring good academic performance.  
32

#### 33 *4.3.2 Factor analysis of influencing factors*

34 In identifying important factors impacting on real estate students' academic performance, the  
35 total of 35 items under the six (6) subdivisions was subjected to factor analysis. To verify the  
36 suitability of the data for factor analysis, an initial analysis was done to ascertain the Kaiser-

Meyer-Olkin (KMO) value and Bartlett's tests of significance. The KMO value was 0.674, exceeding the benchmark value of 0.600 (Tabachnick and Fidell, 2007), while the Bartlett's test is significant ( $p= 0.000$ ), thereby indicating the suitability of the data for factor analysis.

The analysis as shown in Table VI indicates three components explained a total of 37.015% of the variance; the first, second and third components contributing 16.503%, 13.833% and 6.679% respectively.

Table VI. Total variance explained for identified factors

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total
1	5.776	16.503	16.503	5.776	16.503	16.503	5.531

35	.123	.351	100.000				

Note: Extraction Method: Principal Component Analysis.

Table VII shows the loading patterns in the rotated component matrix. The main factors on the first component are lecturers knowledge and depth, lecturers ability to explain difficult concepts, students' participation in class, lecturers accessibility and tutorials and workshop. All the items are related to teaching techniques and lecturers skills and attitude. This apparently implies that with use of improved teaching methodologies and techniques, real estate students' academic performance might be better enhanced. This finding supports the assertion of Cornish et al

(2009) and Boyd (2012) that there is need for a departure from the conventional/traditional methods of teaching real estate courses. This will ultimately help to aid efficiency and effectiveness in the knowledge acquisition process. Under the second component, main factors identified are involvement in extra-curricular activities, students' position and family size, family pressure to excel in the field of study, unavailability of preferred course of study and availability of finances. These items are related to personal factors and parental/family background and it further underscores the need for candidates admitted into the programme to be students who show genuine interest in the course and the importance of good parental and family set up in achieving academic success. This corroborates the findings of Okioga (2013) and Kanagi et al (2015) which underscores the importance of socioeconomic and family background on students' academic performance in higher institutions of learning. While the third component showed fairness in class assessment, lecturers seem to be more interested in testing memorized concepts as opposed to genuine understanding of the field of study, sufficiency and adequacy of lecturers, and mode/method of teaching. This item relates to mode of teaching and assessment, thus supporting the findings of Small and Karantonis (2001), Callan and McCarthy (2003) and Ganyaupfu (2013). Thus, it is expected that with openness and fairness in students' assessment, academic performance will be enhanced though not compromising the requisite academic standard.

Table VII. Rotated component matrix for identified factors

	Component		
	1	2	3
Lecturers knowledge and depth	.769		
Ability of lecturers to explain difficult concepts	.711		
Students' participation in class	.704		.474

## 5. Conclusion

Given the important role being played by university education and the real estate industry in the economy of developed and emerging nations, the need to adequately equip real estate graduate becomes germane. However, several factors contribute to the academic performance, the quality of training and the subsequent perception of these graduates by industry stakeholders. The study complements the body of knowledge on real estate education by providing an insight into important factors that affect academic performance of real estate students from the perspective of the Nigerian emerging economy. The findings from the study revealed that there is a link between students' family background students' academic performance, however, more important is the influence of the teaching method and mode of assessment employed.

An important conclusion from this study is the need to re-evaluate the means/mode of teaching and assessment to align with innovative and international best practice. Also, consequent upon the issue of finance, the universities could be encouraged to ensure a more robust and flexible work-study programme that would ameliorate the financial challenges being encountered by the students. Furthermore, the real estate professionals and academics should be encouraged to

1 undertake more rigorous publicity and public awareness programmes in secondary schools with  
2 the aim of stimulating students interest in the course, thereby reducing the number of  
3 “accidental” real estate students who get admitted to study the course due to lack of admission  
4 into their choice course of study.  
5  
6  
7

### 8 **Limitation and further research**

9 The results of the study must be interpreted with caution, as the study is limited to two of the  
10 three public universities in South Western Nigeria offering real estate as a course. Also, the  
11 paper did not explore learning outcomes and their relationships with the influencing factors  
12 identified.  
13  
14

15 Further research could be conducted across other public universities offering real estate across  
16 the nation’s geopolitical zones and other emerging economies to get more representative result.  
17 Although the findings herein presented could still serve as a reflection of what might be  
18 expected at a more general level. Also, further research could explore learning outcomes and  
19 their relationships with factors influencing students’ academic performance.
