

A 3D city model background showing a complex road network with various levels of detail. The roads are rendered in shades of grey, yellow, and green, with some areas highlighted in light blue. The model is set against a light blue sky.

Modelling different levels of detail of roads and intersections in 3D city models

Freek Boersma

Supervisors: Anna Labetski, MSc & prof. dr. Jantien Stoter

MSc Geomatics for the Built Environment
Faculty of Architecture and the Built Environment,
Delft University of Technology

12 July 2019

2D to 3D geo-information

- Increase in creation and use of 3D geo-information
- 3D data can be stored in 3D city models

Level of Detail (LoD)

Computer graphics

- Geometric complexity of modelled object

Level of Detail (LoD)

Computer graphics

- Geometric complexity of modelled object

3D city models

- Model's usability
- Level of approximation to real world features
- Quality measure for 3D city model
- Each level suited for a group of applications

- Data model *and* XML encoding
- Thematic modules: buildings, transportation, vegetation, etc.
- Five LoDs: LoD0 – LoD4. Focus on buildings.
- Spatio-semantic coherence

¹Open Geospatial Consortium (2012). *OGC City Geography Markup Language (CityGML) Encoding Standard*.

Road modelling

Roads are often modelled as either lines or surfaces.

CityGML Transportation module

TransportationComplex provides linear network with line objects

→ line objects

TransportationComplex provides surface geometry describing the actual shape of the object

□ TransportationComplex (Surface geometry)
■ Terrain surface

Surface geometry is divided thematically into TrafficAreas, like:

■ Traffic - cars
■ Traffic - emergency lane
■ Traffic - restricted area
■ Auxiliary - grass

2

²Open Geospatial Consortium (2012). *OGC City Geography Markup Language (CityGML) Encoding Standard*.

CityGML Transportation module

- Road LoD specification not well-developed
- Government officials and road data users identified drawbacks

²Open Geospatial Consortium (2012). *OGC City Geography Markup Language (CityGML) Encoding Standard*.

Central object registration

- Government gathers object data in different key registers
- Issues with linking data

Central object registration

- Government gathers object data in different key registers
- Issues with linking data
- Moving towards central object register (COR)
- Incorporate 3D data
- Incorporate both linear and areal road data

Motivation

- Government moving towards object-oriented 3D geo-information
- Many road data use cases identified
- Data users benefit from having clear LoD definitions
- CityGML Road LoD specification not well-developed

Research question

How can roads and intersections be modelled in 3D city models at various LoDs such that it suits user needs?

Research question & sub-questions

How can roads and intersections be modelled in 3D city models at various LoDs such that it suits user needs?

- What are the use cases of roads and intersections in 3D city models and what are their road data needs?

Research question & sub-questions

How can roads and intersections be modelled in 3D city models at various LoDs such that it suits user needs?

- What are the use cases of roads and intersections in 3D city models and what are their road data needs?
- What road standards exist, and how do they model the identified data needs?

Use case data needs analysis

	Areal			Linear		
	LoD1	LoD2	LoD3	LoDo.1	LoDo.2	LoDo.3
Road repair			x			
De-icing roads		x	x		x	x
Disaster management			x			x
Surface heat monitoring		x	x			
Air quality monitoring	x	x	x			x
Visibility analysis		x	x			
Noise mapping	x	x	x			x
Traffic light configuration			x			x
Traffic simulations		x	x		x	x
Routing / navigation				x	x	x
Autonomous driving			x			x

Use case data needs analysis

Data needs

- **LoD specification.** LoD0.1 – LoD0.3, LoD1 – LoD3.
- **Graph structure.** Implement a graph structure such that LoD0.1 up to LoD0.3 can be modelled as a network.
- **Attributes.** Many attributes were identified which might be useful.
- **Road segments and linking representation types.** How to link segments of linear and areal road objects together?
- **Intersections.** Intersections and roundabouts need explicit modelling, including specific turning lanes, turn restrictions, way giving information and stop lines.
- **Connecting to other modules.** Link Road surfaces with Bridge surfaces when a road is on a bridge.

Implementing changes in CityJSON

- CityJSON structure defined by JSON schemas
- CityJSON core: encoding of the CityGML data model

Implementing changes in CityJSON

- CityJSON structure defined by JSON schemas
- CityJSON core: encoding of the CityGML data model
- Data model can be extended with Extensions: new CityObjects and attributes can be added.

- Implementing data needs: changes in core, and new Extension

Starting point: new LoD specification

Starting point: new LoD specification

LoD0.1

LoD0.2

LoD0.3

Graph structure

- New CityObject classes in Core: Node and Edge.
- Nodes have attribute edges: incident edges
- Edges have attributes startNode, endNode

- In Extension: RoadNode and RoadEdge
- Graph structure can be reused for other object classes
- This gives the desired topological structure

Network attribute modelling

- Many linear attributes from data needs
- No over-fitting data model to assessed use cases
- Geography-related attributes not added: can be deduced from areal data

- Will model: allowed vehicle types, road classification, driving direction, administrator, maximum speed.

- Other attributes may be added in Extension per use case

Network attribute modelling

- Linear referencing vs node based attribute modelling.
- Choose attribute based.
- Linear referencing system may always be added.

Network intersections: LoD0.1

- Add turning restrictions for intersection / roundabout RoadNode

Network intersections: LoD0.2

- RoadNodeType: Intersection and Roundabout
- RoadEdgeType: Connecting and Roundabout

Network intersections: LoD0.3

- RoadNodeType: LaneSplit, Intersection and Roundabout
- RoadEdgeType: Connecting and Roundabout

Segments and linking representation types

- Central object register: linking representation types.
- Node based attribute changes lead to highly segmented network
- Areal road segmentation already possible through semantic surfaces

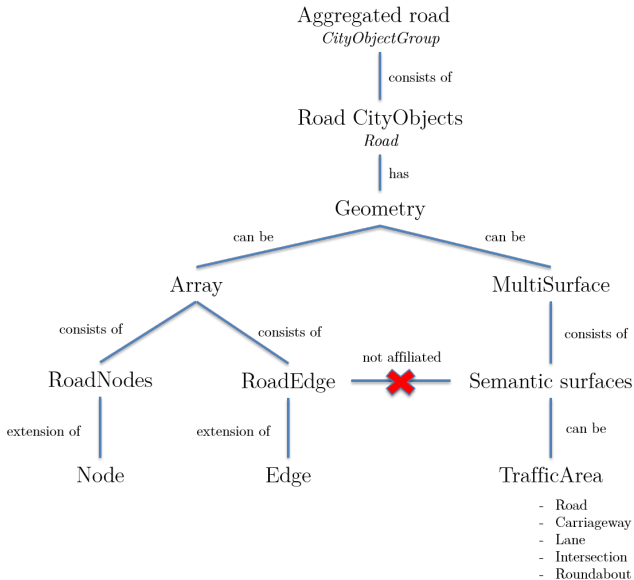

Segments and linking representation types

- Central object register: linking representation types.
 - Node based attribute changes lead to highly segmented network
 - Areal road segmentation already possible through semantic surfaces
-
- Choice: linking types on an aggregate level
 - Thus: segments implemented differently for linear and areal representations!

Segments and linking representation types

Segments and linking representation types

Areal LoD specification

Object	Attribute	Value	Areal		
			LoD1	LoD2	LoD3
Road	roadType	Road	x		
		Carriageway		x	
		Lane			x
		Intersection	x	x	x
		Roundabout	x	x	x
	class		x	x	x
	function		x	x	x
	intersectionID		x	x	x
	streetName		x	x	x
	bridge		x	x	x
administrator			x	x	

Research overview

- ④ Discussion & future work

Research overview

- ① CityGML shortcomings and data needs analysis
- ② Improving the data model
- ③ Creating road data files**
- ④ Discussion & future work

Creating CityJSON road data files

Goal is to reflect on the modelling choices made.

- Source data: areal and linear data from Noord-Brabant
- Provincial road N640
- Create a data file per LoD
- Create a data file linking two representation types

LoD3

- Dataset specified per lane.
- Easy to map to CityJSON

LoD1-2

- Awkward merging
- What to do with AuxiliaryTrafficArea?

LoD0.2 – 0.3

- Strict geometric modelling: lots of preprocessing
- Nodes with semantics need to be generated, and pointers from RoadNodes to RoadEdges and vice versa established

LoD0.1

- Road centre line data present in data set

Linking LoD1 & LoD0.1

- Object defined by hand. This could be done on an existing attribute

Research overview

- ① CityGML shortcomings and data needs analysis
- ② Improving the data model
- ③ Creating road data files
- ④ Discussion & future work

Research overview

- ① CityGML shortcomings and data needs analysis
- ② Improving the data model
- ③ Creating road data files
- ④ Discussion & future work

Discussion

- Goal was to accommodate! Accommodate user and provider by giving clear but not over-fit LoD specification.
- Results based on mostly network use cases. Areal LoDs might have extra data needs not assessed.
- Node-based segmentation: low LoD but highly detailed..?

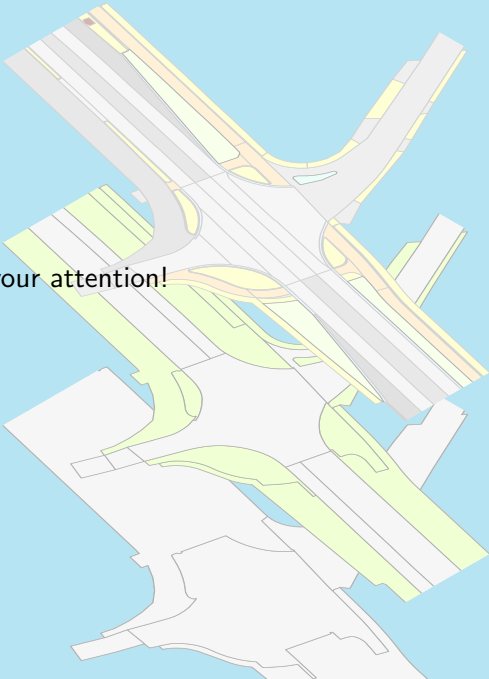

Discussion

- Is linking representation types necessary?
- Is 3D road data necessary?
- How did CityJSON influence design choices? Object-based nature aided linking of representation types. How does this generalise to Transportation in CityGML?

Future research

- Focus on roads. How do we incorporate bicycle paths, footpaths, or other Transportation objects like Railway?
- Further specification of areal representation and AuxiliaryTrafficArea?
- Add semantic validation of new data model.
- Create general CityJSON road writer program that does data processing itself.
- How to use the graph structure for routing?

Thank you for your attention!
