

Opening the bottle:

Designing openable surfaces in a mono material construction of recycled PET

P5 presentation
Ma Thesis TU Delft

Noah van den Berg
4282620

Primary tutor:
Paul de Ruiter

Secondary tutor:
Fred Veer

Graduation track: 'living in a bottle'

- Non sustainable material usage
- Mono material construction
- Waste stream material
- Tiny house

My assignment: opening the bottle

- Usability of the tiny house

Design challenges:

- No function specific materials
- Form dictates function
- Multi curved wall

How can an openable surface be included in a mono material 3D printed tiny house, using FDM 3D printing?

- How can geometry allow for a surface to be moved?
- What are the criteria for an openable surface?
- What are the physical and structural properties of recycled PET?
- How can one optimize geometry for 3D printing?
- How does a 3D-printed openable surface hold up under use?
- How does the openable surface connect to the structure of the 3D printed tiny house?

Source	Young's modulus
CES virgin PET (unfilled, semi-crystalline)	2760 – 3100 MPa
Recycled PET(Ultrafuse rPET)	1334 – 1640 MPa
Calculated based on 3 point bend test	600 MPa

Design Criteria

Research question

Methodology

Preliminary test &
research results

Design criteria

- Shortened use period (25 years)
- PET only & as few components as possible
- Usability (clarity & ease of use)
- Structural capabilities
- Wind & watertight
- Maintenance

Design steps

Production criteria for PET 3D printing

Fabrication

- As little material as possible (time & cost)
- No sharp corners

Research question

Research question:

Methodology

How can an openable surface be included in a mono material 3D printed tiny house, using FDM 3D printing?

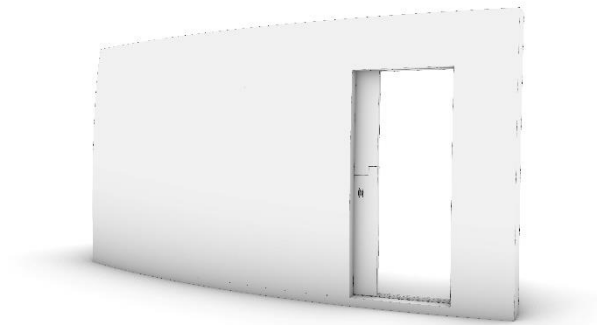

Preliminary test & research results

Design criteria

- Internal sliding system
- Farm door
- Wheels for layer orientation

Design steps

Fabrication

Design criteria

Design steps

Fabrication

Small scale tests

Structural analysis

Conclusion

Reflection

- Two underestimated challenges
 - Complexity of multicurved surfaces
 - Importance of maintainance
- Suggestions for follow-up research
 - Topologically optimized infill
 - Full scale of the completed tiny house

TBD
