Campus and Real Estate (CRE):

TU Delft is a CO₂ neutral and circular campus by 2030.

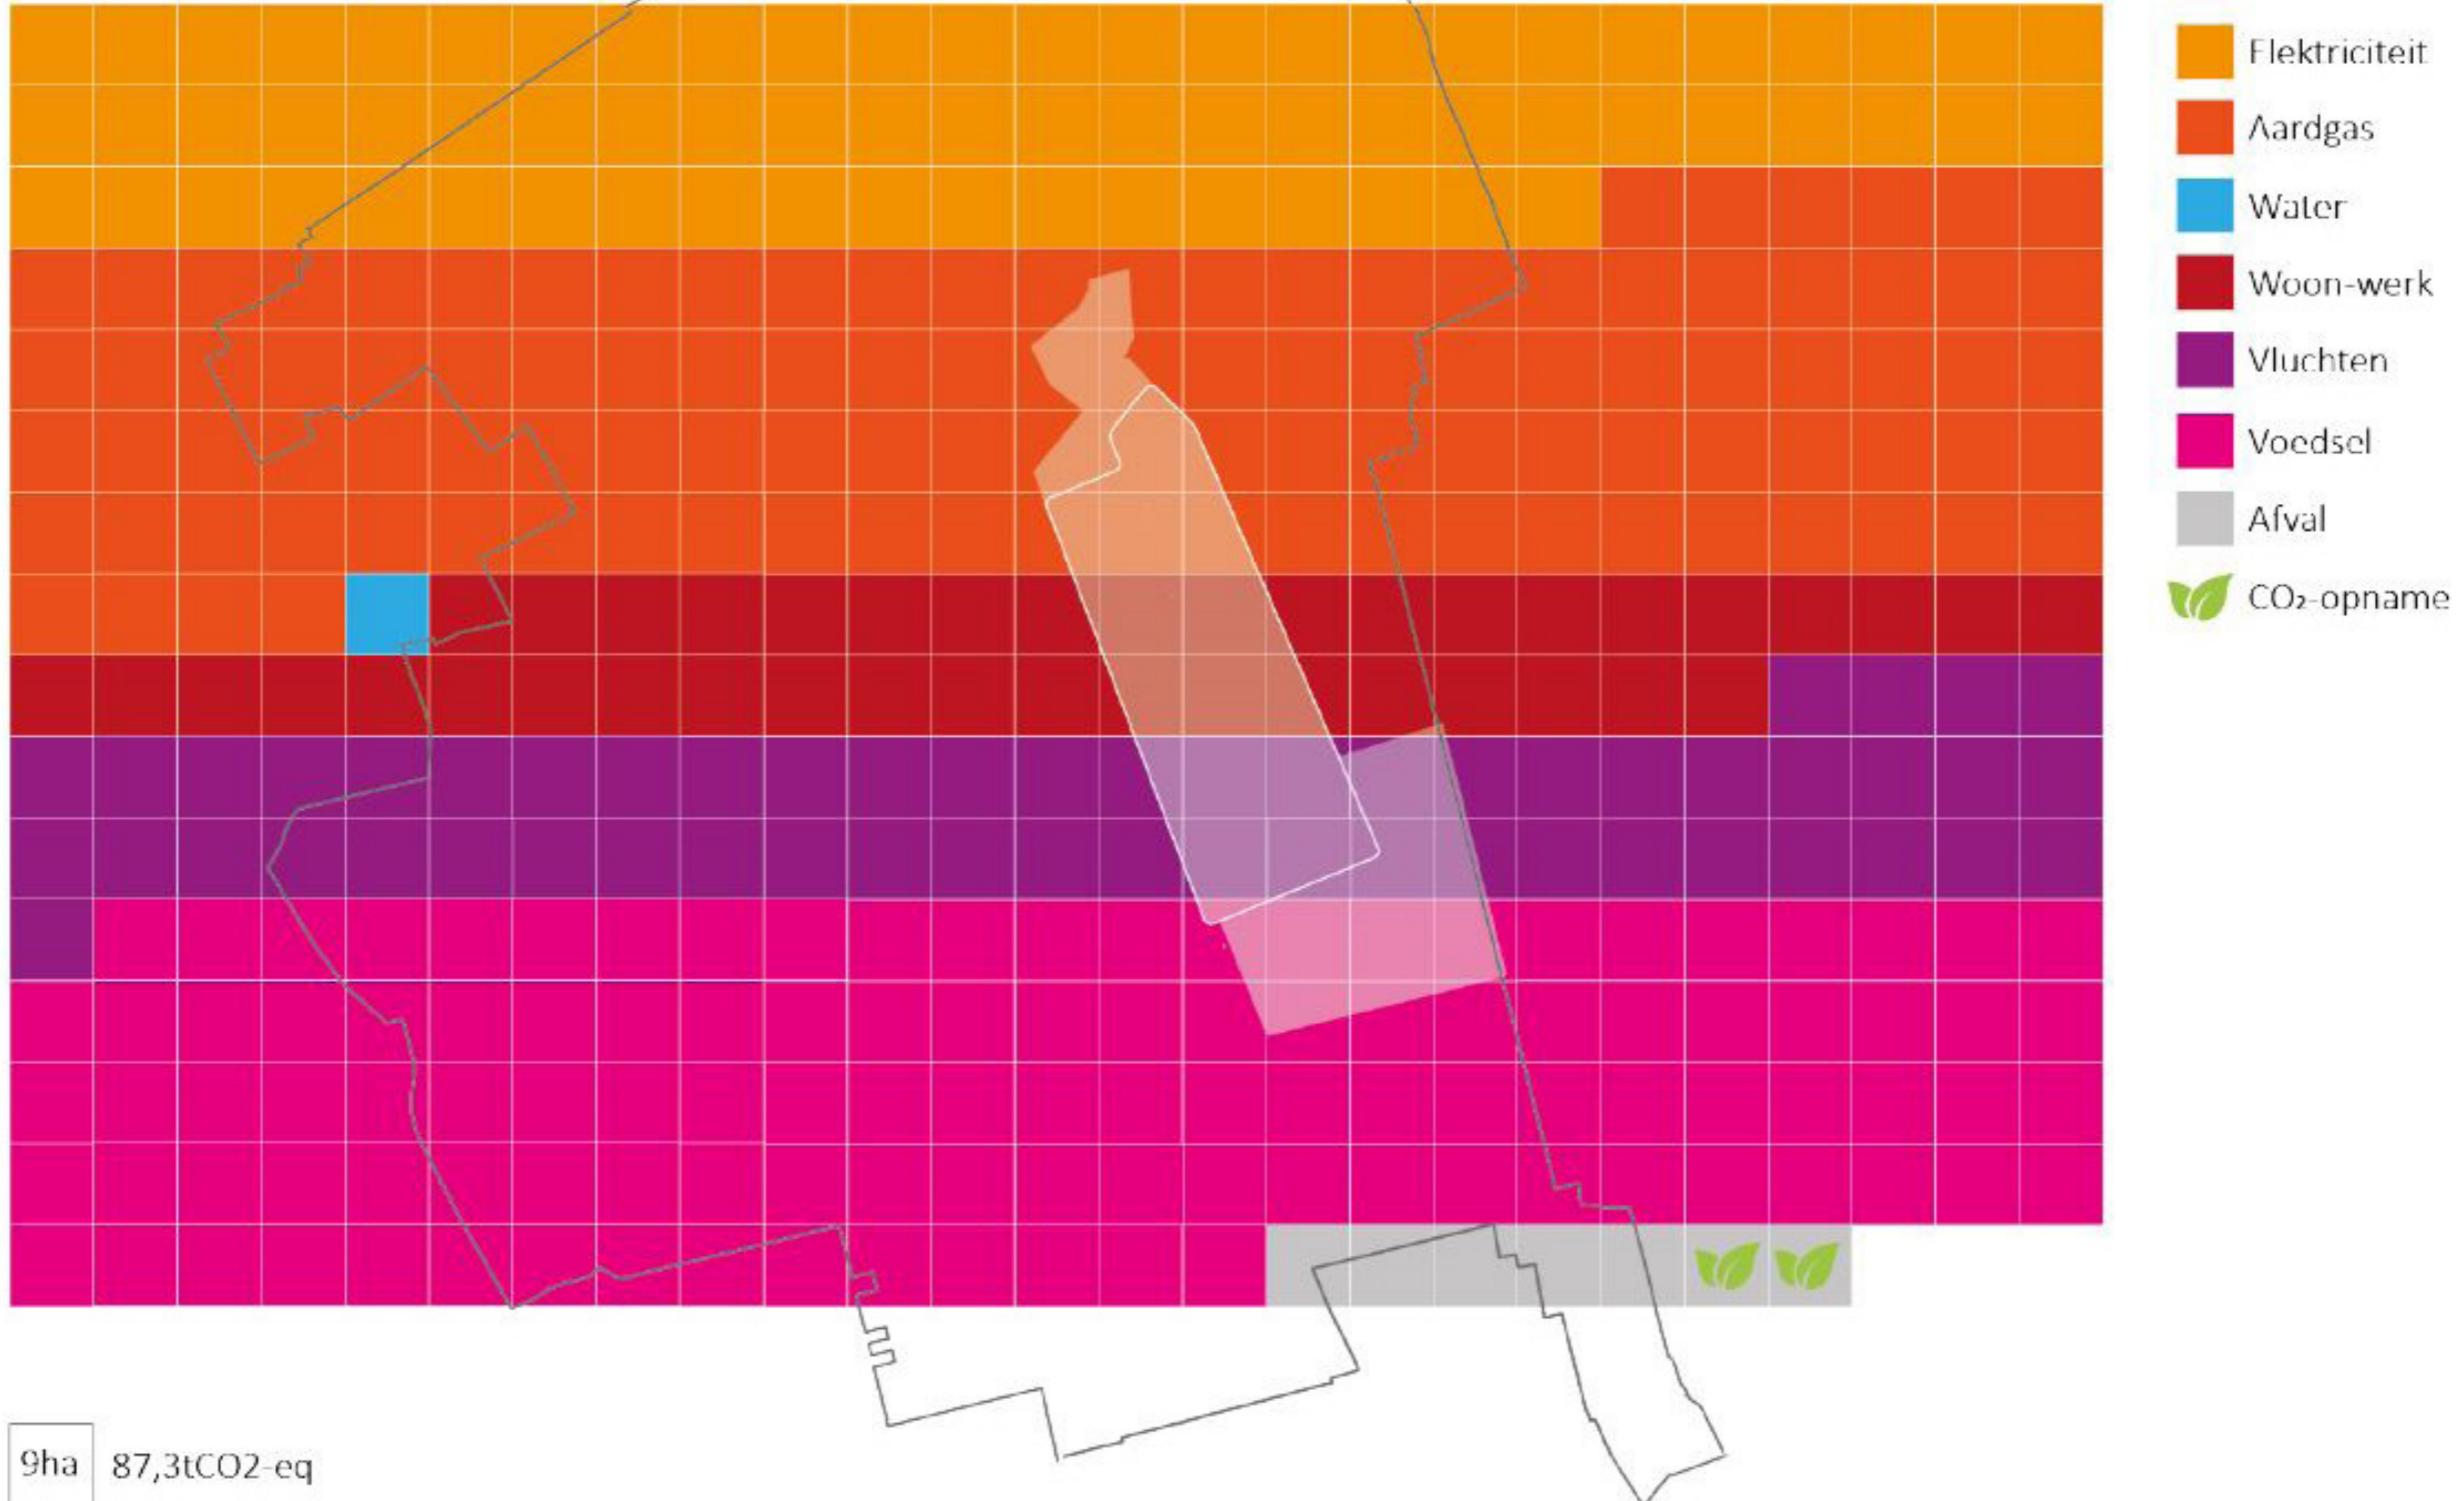

European Green Deal:

"achieve climate neutrality by 2050"

European Commission, (2019) The European Green Deal, Communication from the commission to the European Parliament, Brussels
TU Delft, (2018), Impact for a better society, TU Delft strategic framework 2018-2024

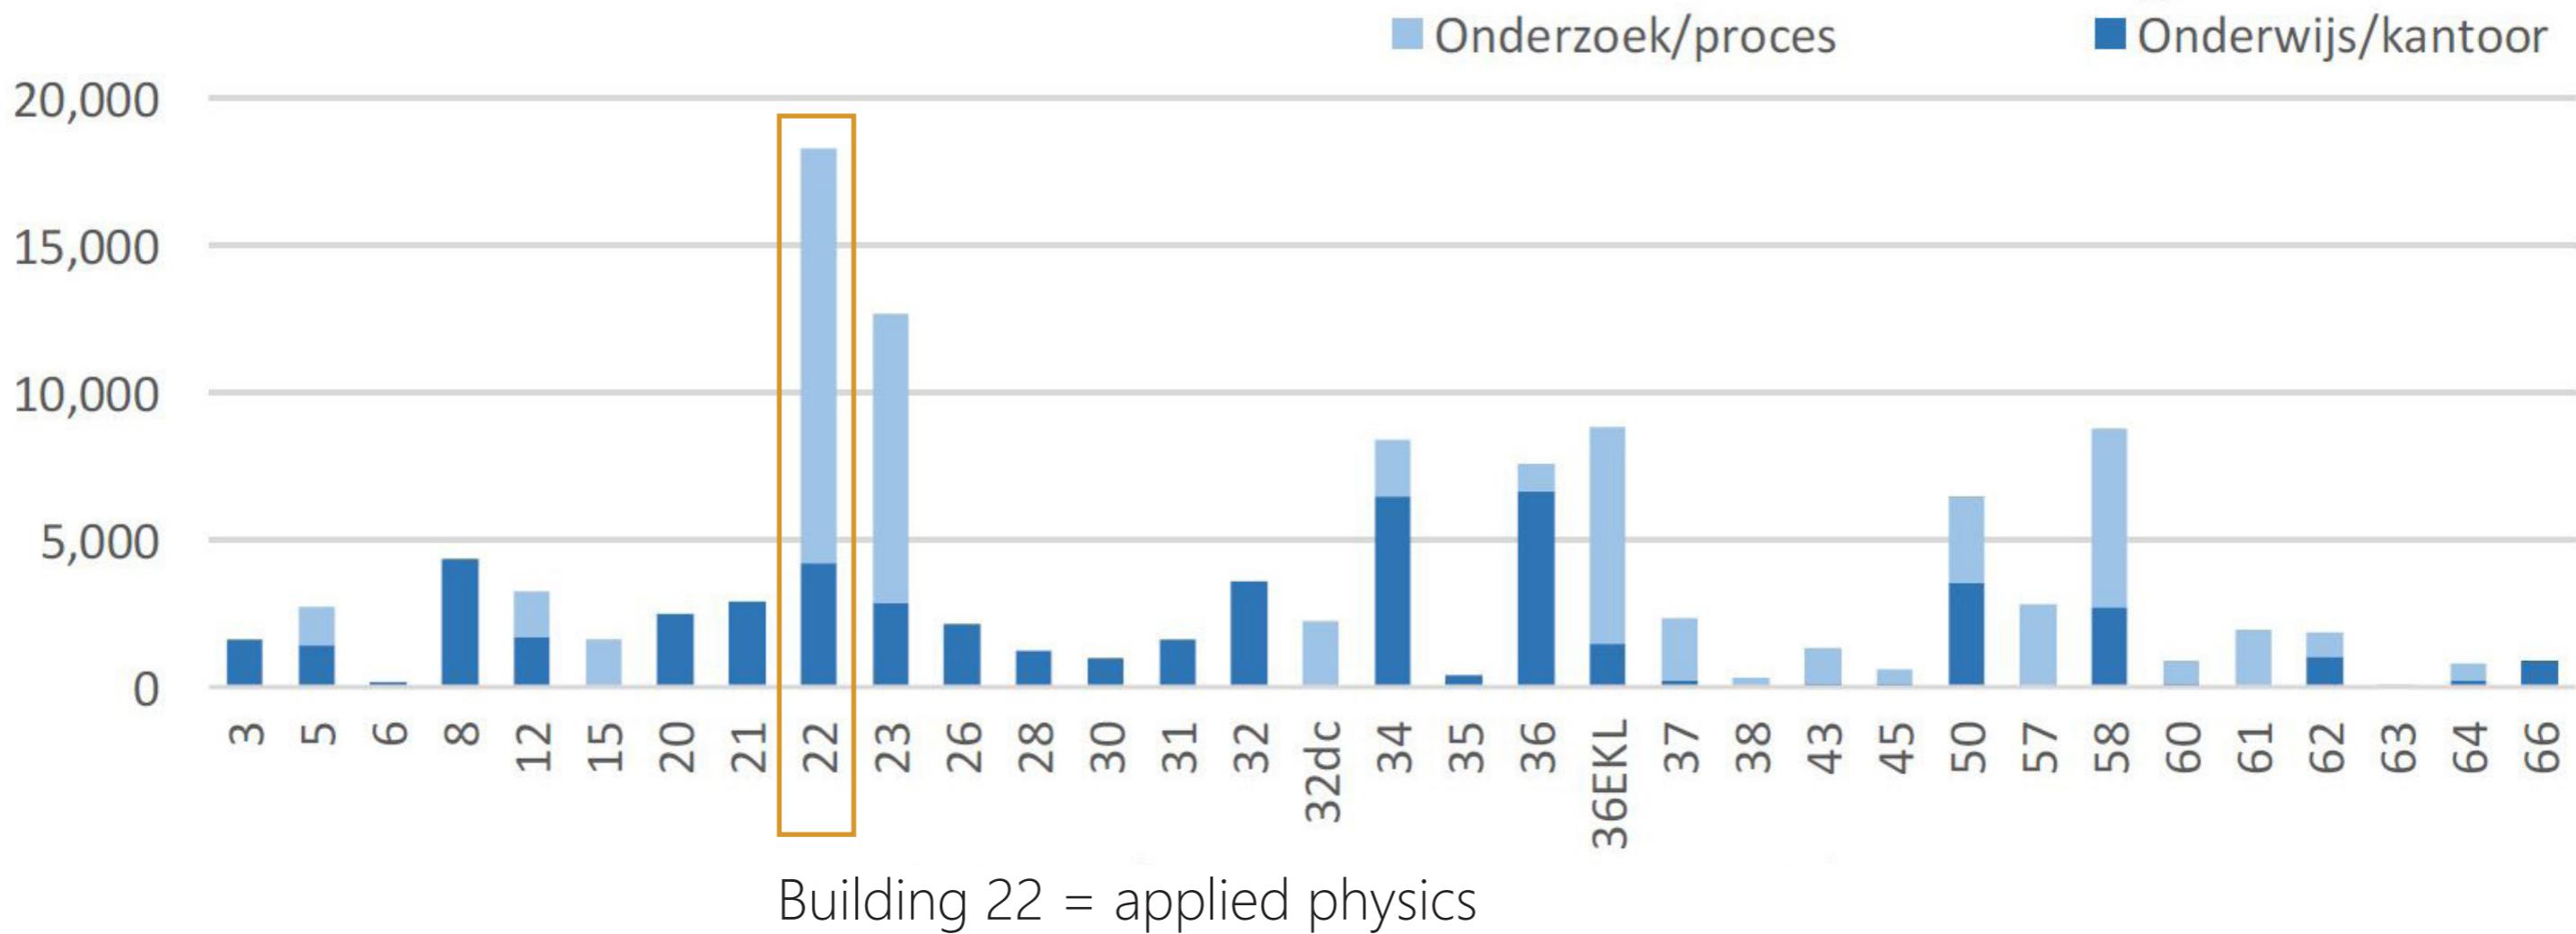

CURRENT STATE - CO₂ EMISSIONS

47.957 tCO₂-eq

CURRENT STATE - ENERGY

Energy consumption MWh
Heat & electricity combined

Approximately

5-15 %

circular

Lack of knowledge on the current flows at the TU Delft campus

re-design

re-use existing materials

renovate

flow research: electricity, heat & materials

OVERALL DESIGN QUESTION

How to design and redevelop building 22 Applied Physics on the TU Delft campus using **circular design techniques**, connecting the **flows** on a local level and **reuse existing materials** to achieve the goals of a fully circular, energy neutral and CO₂ neutral campus?

Techniques

What circular design techniques exist?

How can they be used for the redevelopment of the building?

Flows

How do the flows work?

How can we close the electricity, heat and material loops?

Materials

What materials are present in the building?

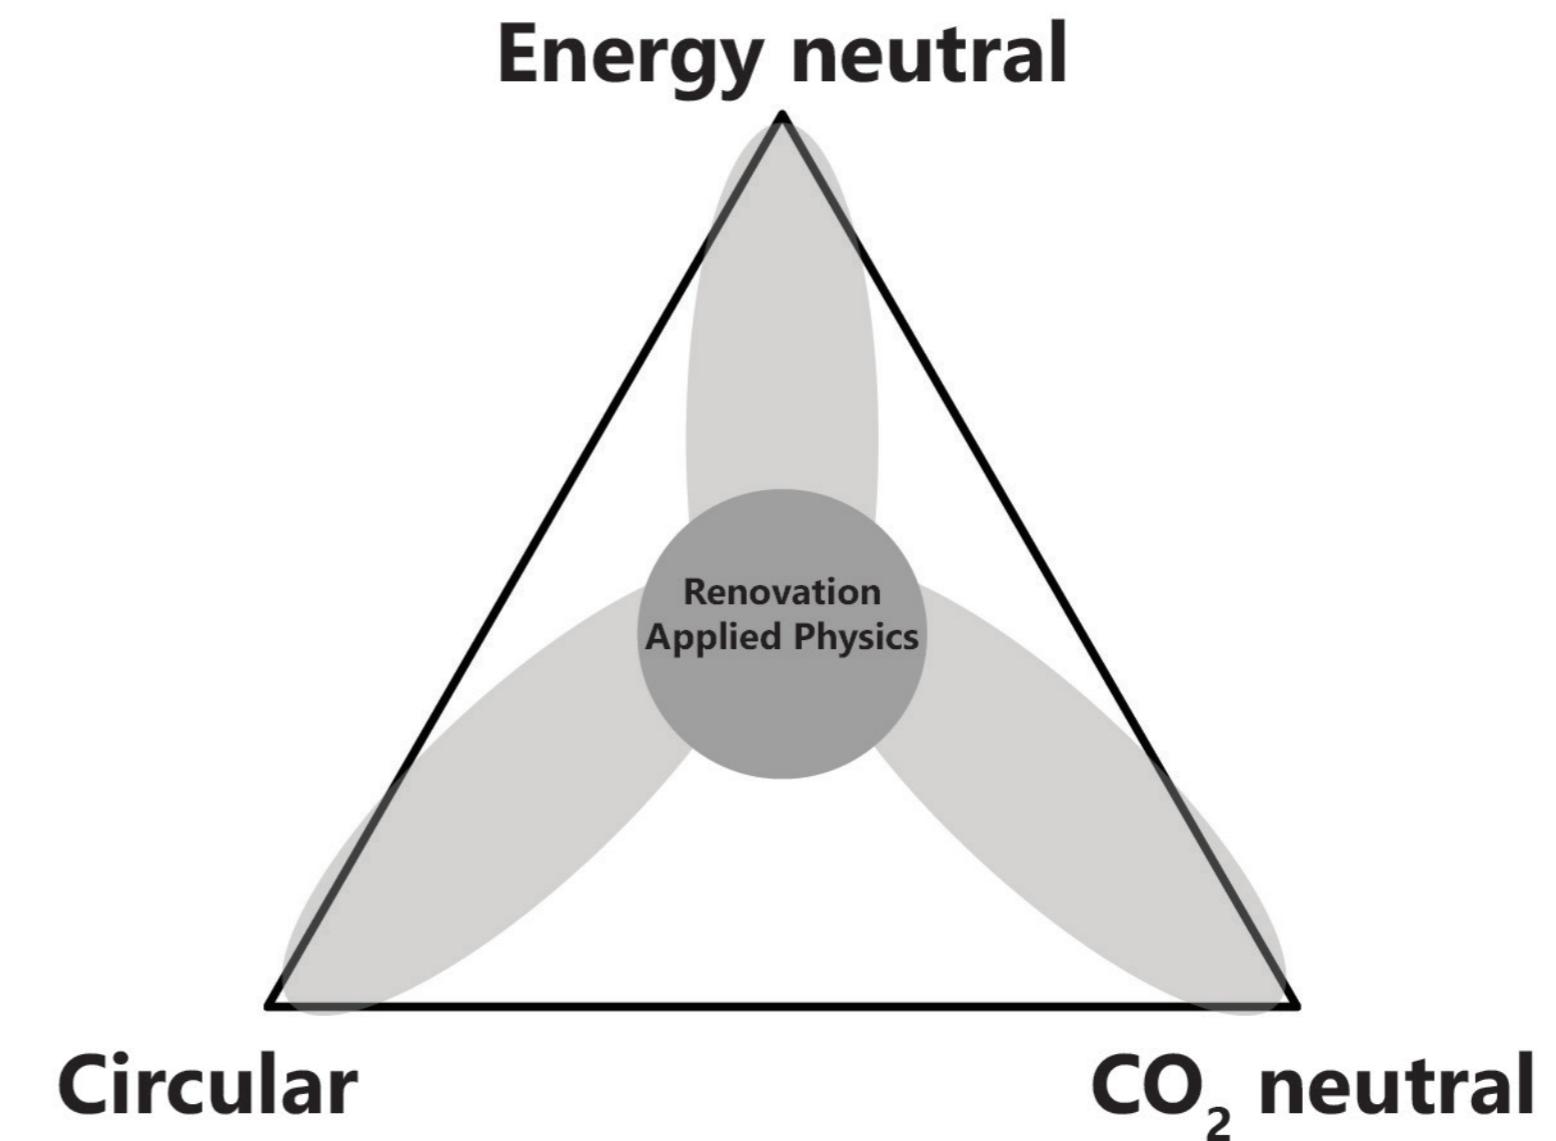

What is their re-use potential?

What materials need to be harvested to redevelop the building?

Using local energy and material flows to redevelop the Applied Physics building as part of a circular and CO₂ neutral TU Delft campus

OVERALL DESIGN QUESTION

How to design and redevelop building 22 Applied Physics on the TU Delft campus using circular design techniques, connecting the flows on a local level and reuse existing materials to achieve the goals of **a fully circular, energy neutral and CO₂ neutral campus?**

THEMATIC RESEARCH QUESTION

What interventions are needed in **building 22 Applied Physics** to reduce its current impact by using the available **flows (heat, electricity and materials)** and their potential to redevelop the building into a fully circular, energy neutral and CO₂ neutral building?

The building

What is the current impact of the building on its environment?

How can we reduce this to reach the goals?

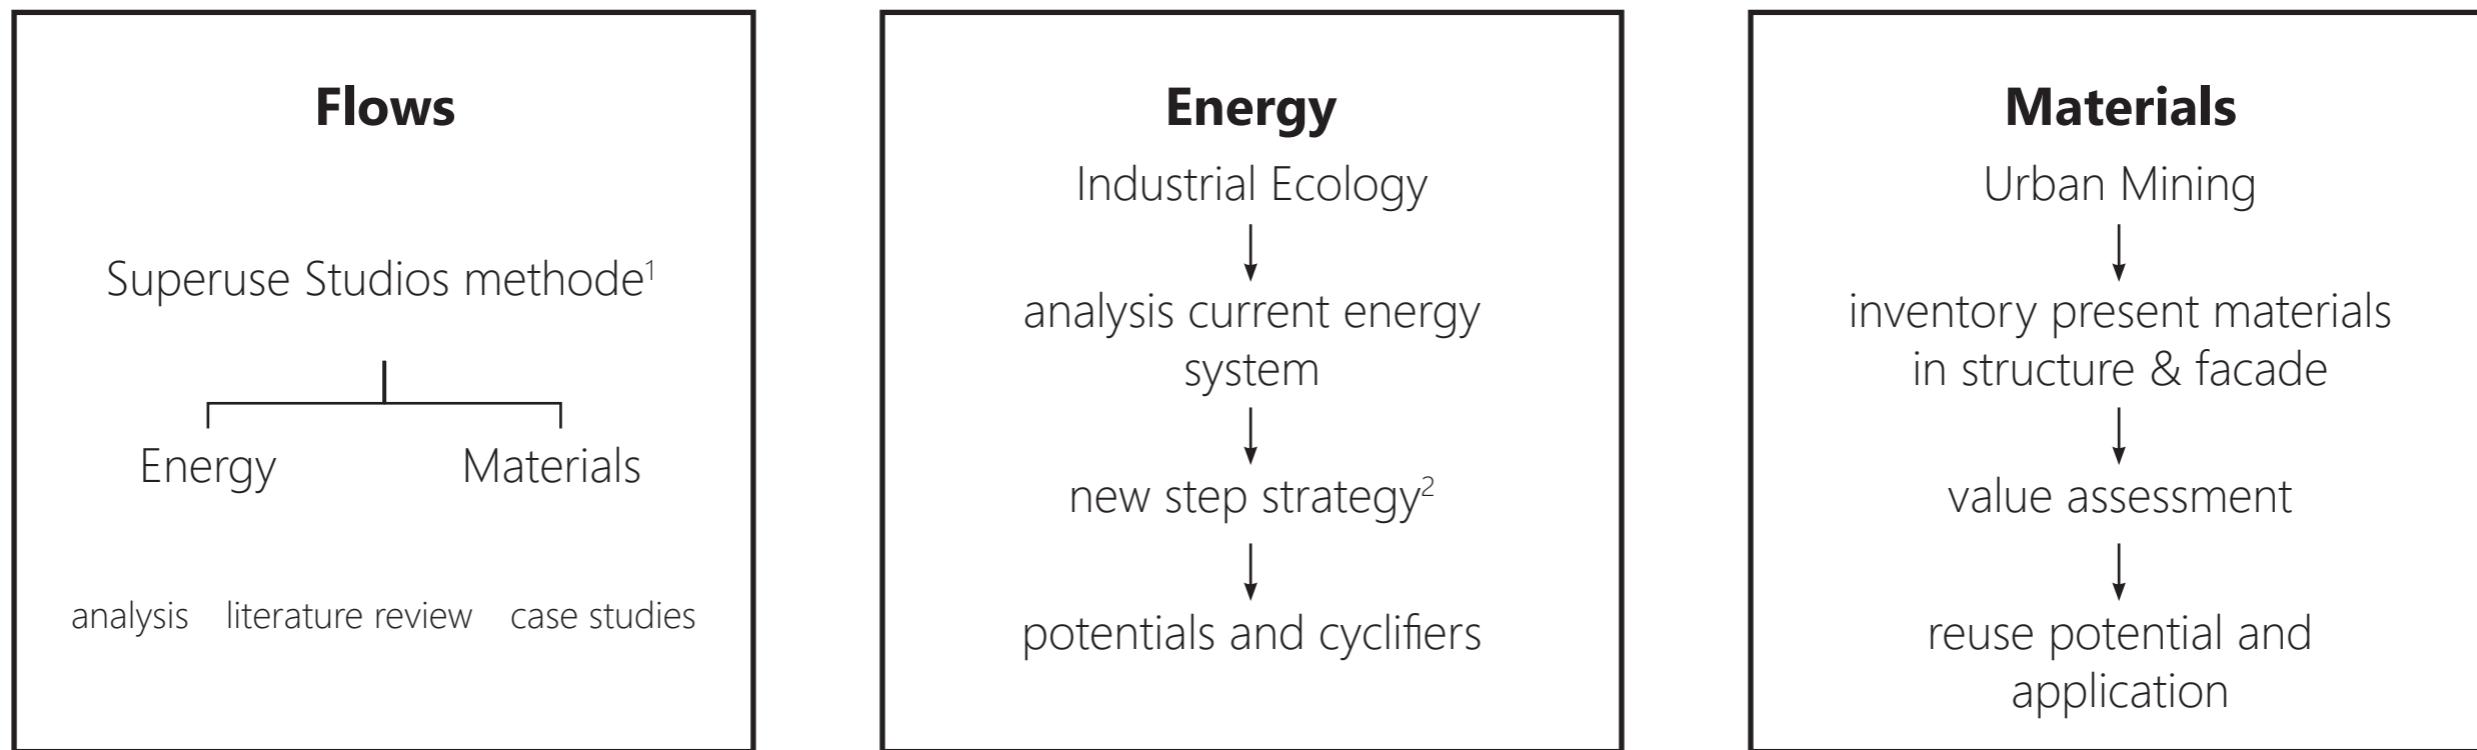

Flows

What is the current situation of these flows?

How can we close the electricity, heat and material loops?

A roadmap with interventions needed to redevelop the building as part of a closed loop energy and material system

METHODOLOGY

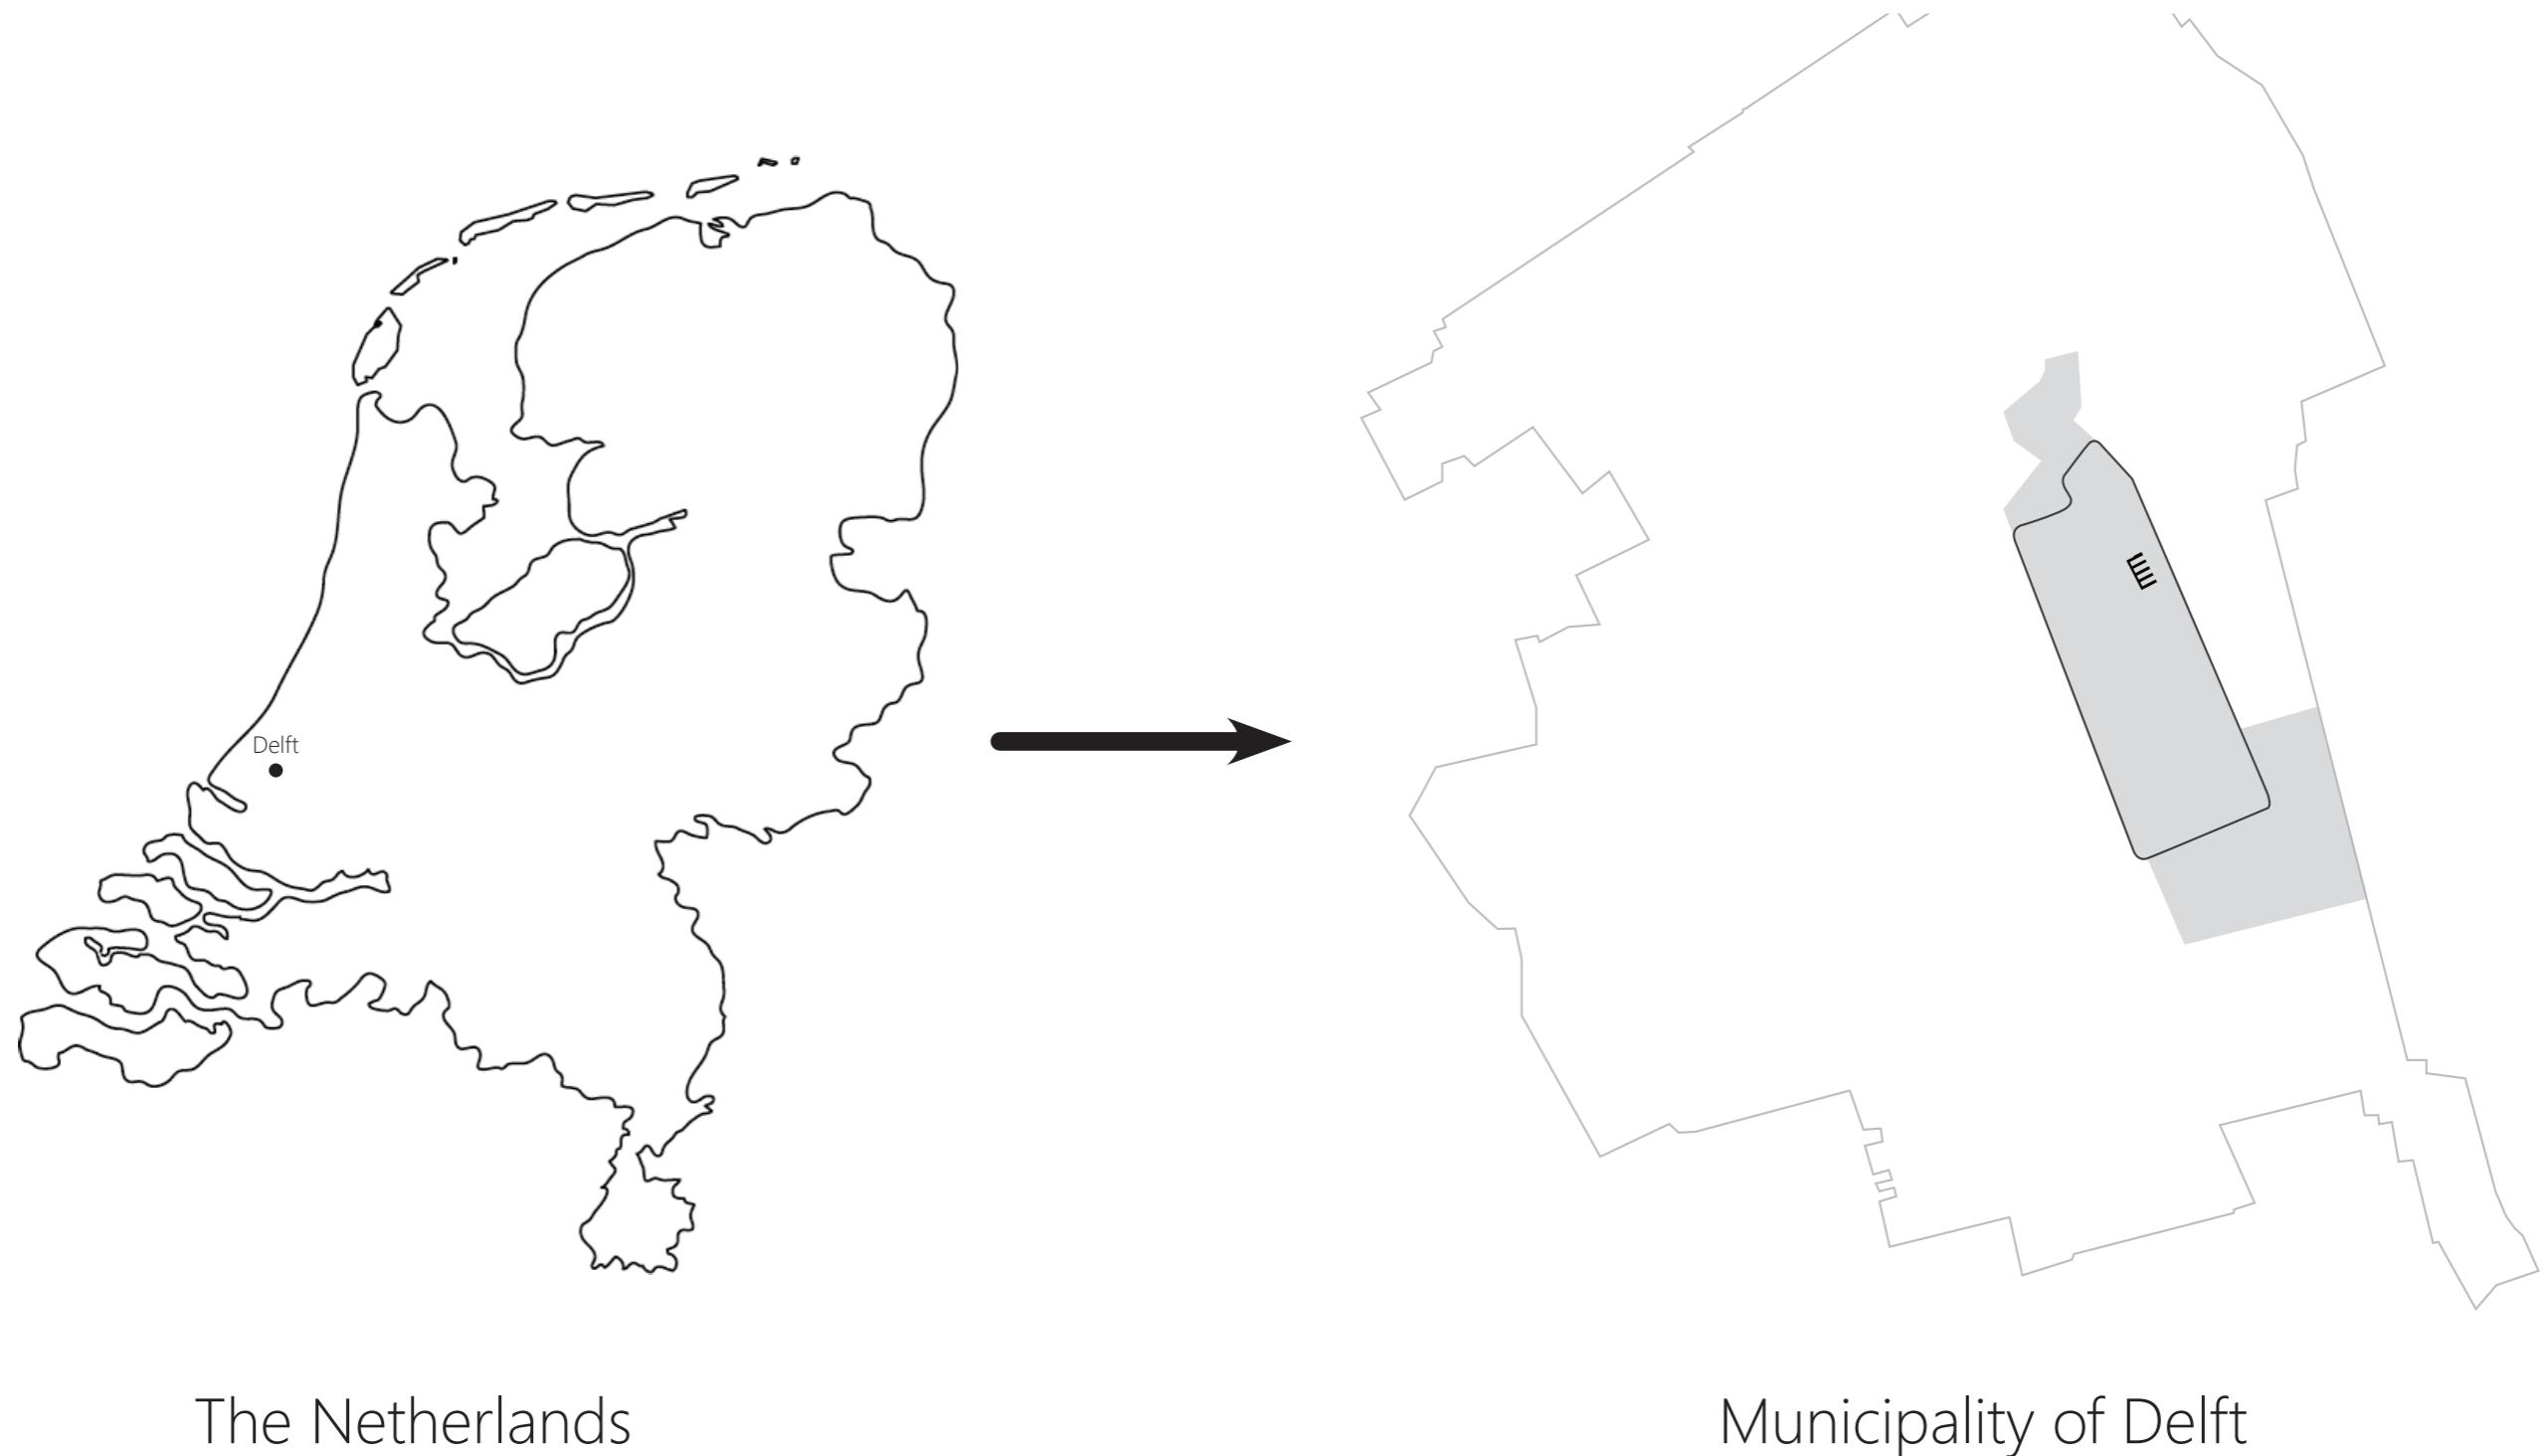

outcome research: roadmap

1: Jongert, J. (2014), INSIDEflows research group 2013-2014 reader, 2012 Architecten, & Goossens, F. (2009). Recyclicity: Industrial Ecology applied in the urban environment.
2: 0) research current situation 1) reduce 2) reuse 3) produce sustainably A. van den Dobbelaer (2008)

TU DELFT CAMPUS - SWOT

Strengths

- High-quality facilities (labs, equipment, etc.)
- Strong start-up ecosystem
- Variety of cafe's and food options

Weaknesses

- **Lots of green but of low quality**
- Current buildings are in need of renovation
- **Campus lacks a 'pulsing heart'**
- At night the campus is desolate
- Insufficient bike parking opportunities

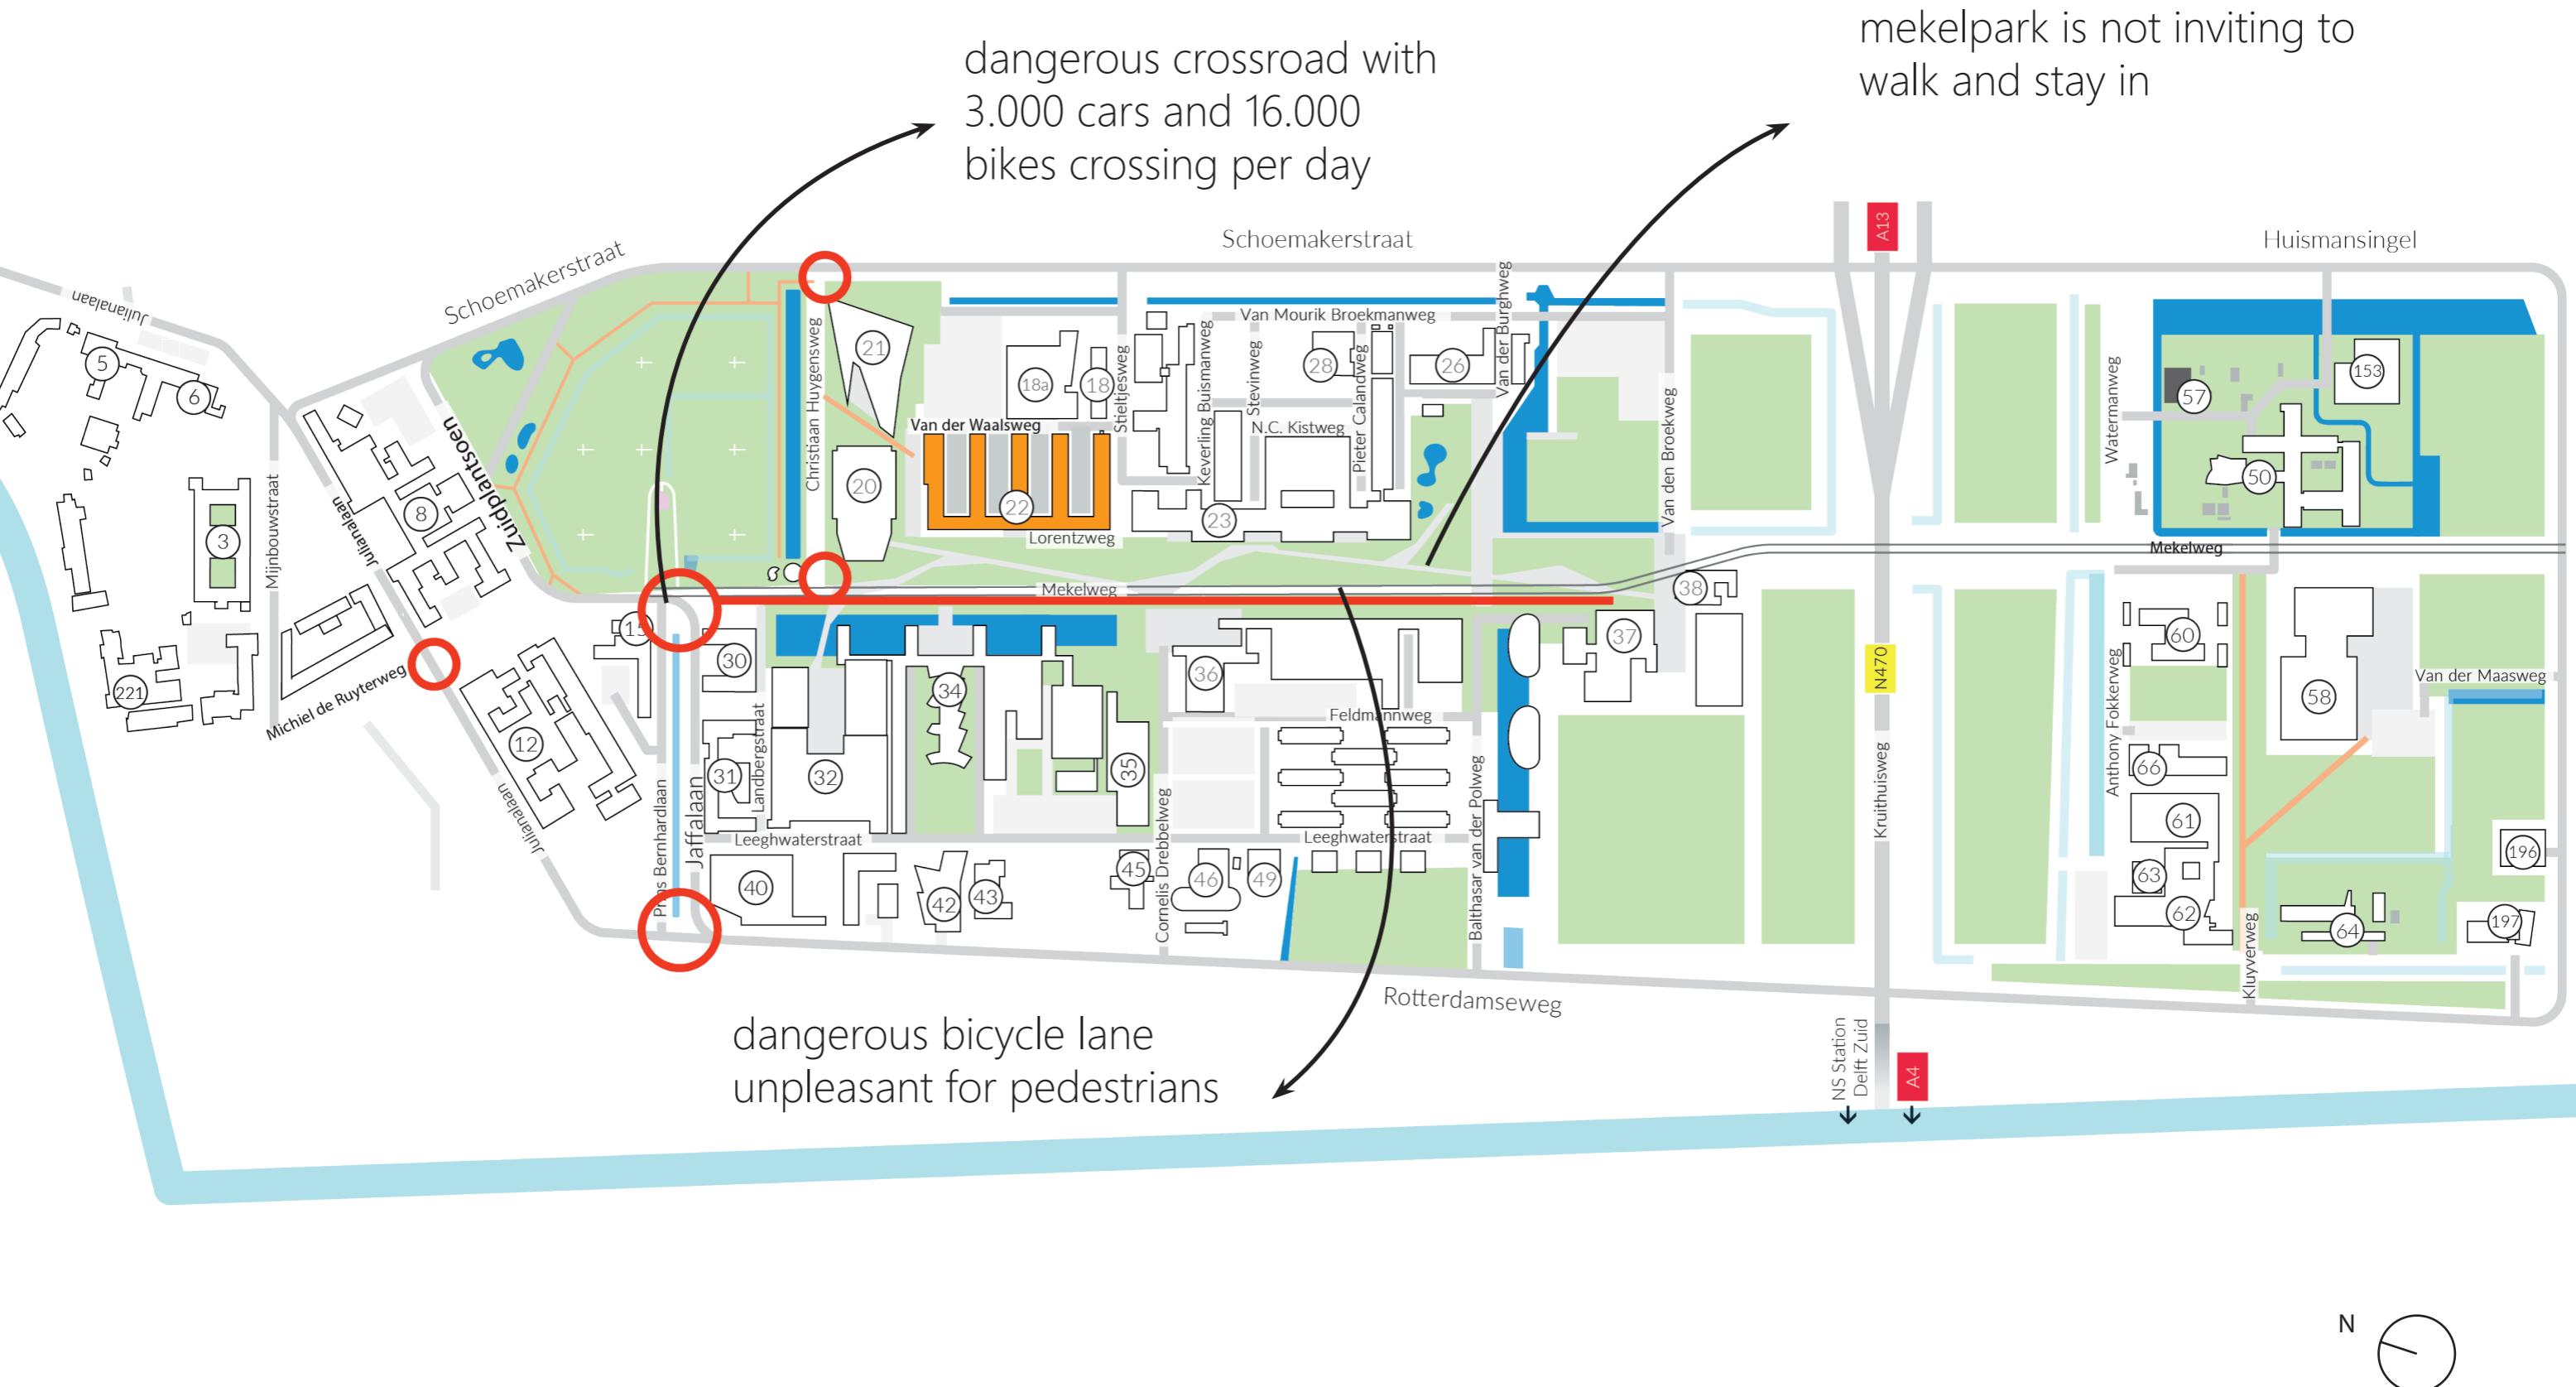

Opportunities

- Re-development campus
- Digitisation
- City-as-campus & Campus-as-city
- Living lab in Mekelpark

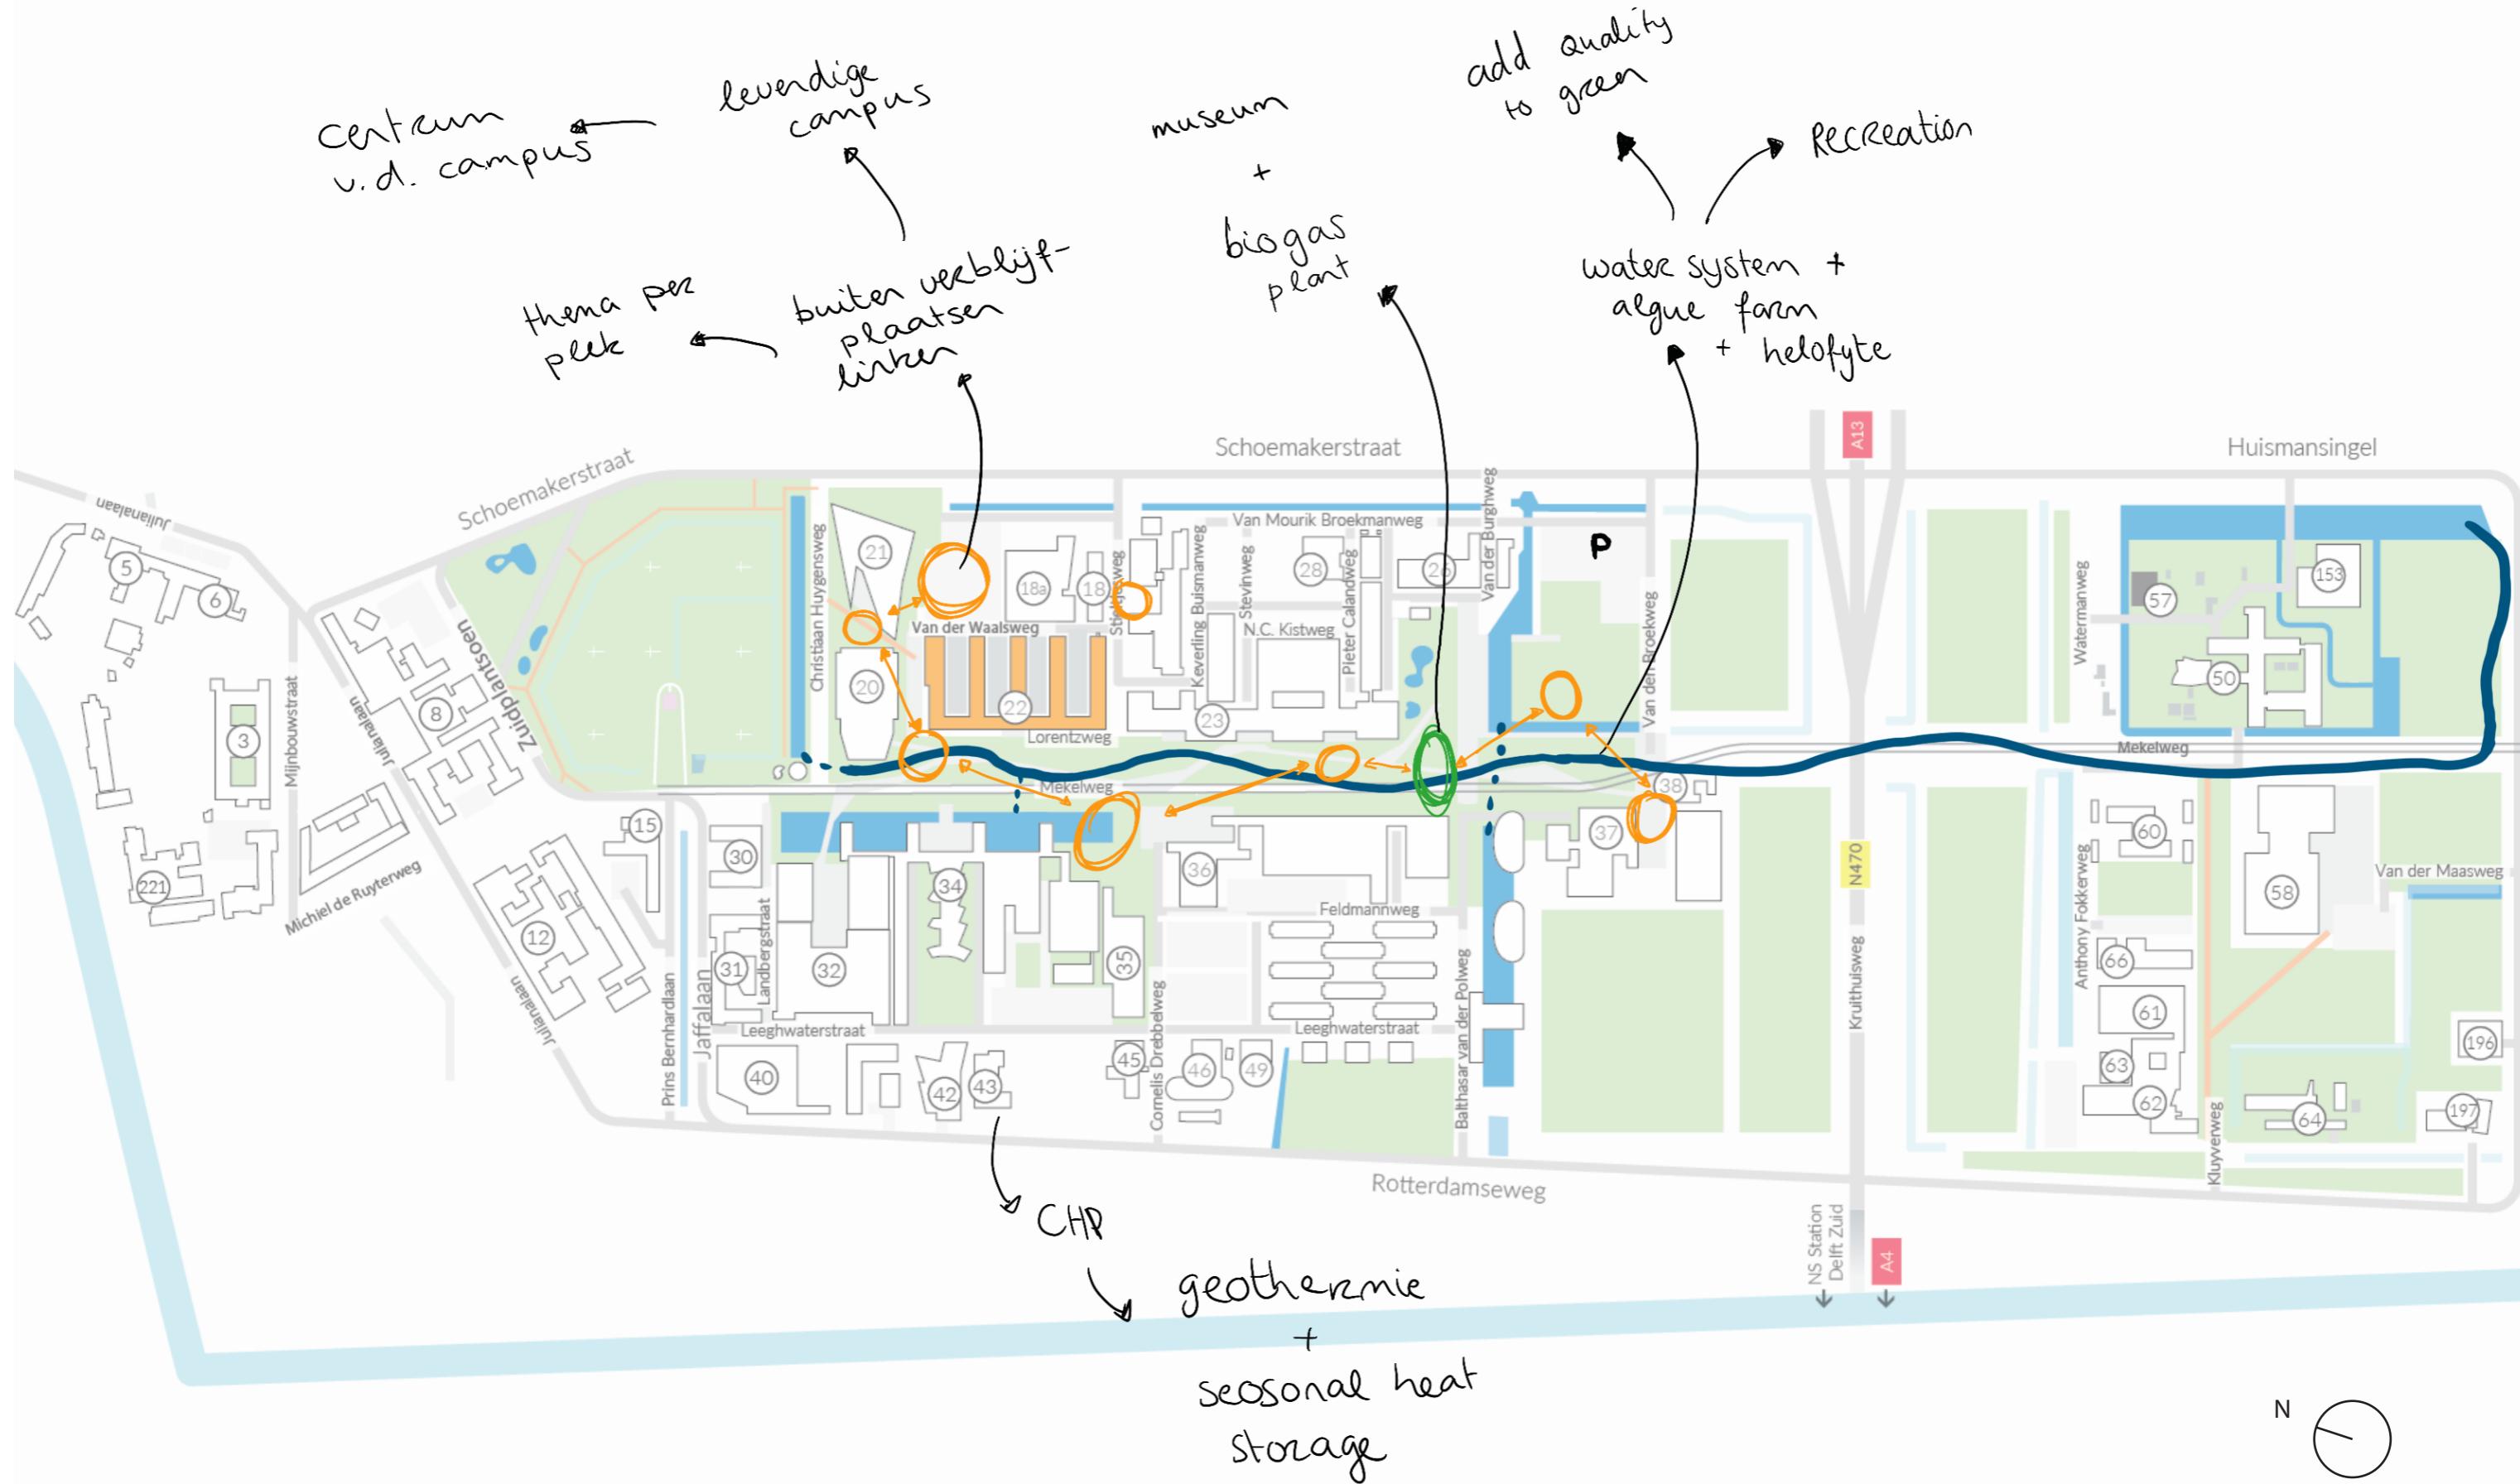

Threats

- **Bikes and car traffic create unsafe situations**
- High maintenance costs for estate
- 'anderhalve-meter-samenleving' results in a (temporary) change of available workspaces

REUSE POTENTIAL & APPLICATION

roadmap

	<i>Needed cyclifiers to close the system</i>	<i>Interventions needed to the campus to become circular and CO₂ neutral</i>	<i>Interventions needed to improve the performance of building 22</i>	<i>Other design aspects</i>
Energy	Geothermal energy	→ Connection to CHP	Lower energy demand to maximum of 100 kWh/m ²	Integration of an atrium as thermal buffer
	Seasonal Thermal Storage		Improve thermal insulation	Improve accessibility of the building
	Biogas plant	→ Compatible pipes for biogas → Connection to CHP → Connection to sewer system and organic waste collection	Install a domotics system	Stimulate social interaction
	Algae plant	→ Connected to CO ₂ pipes from CHP → Connected to biogas plant	Separate organic waste	Optimize natural light
	CHP	→ CO ₂ cather → Compatible burning biogas and natural gas	Update sewage system	Separate rain, gray and black water
	PV panels	→ Placement on roofs and facades	Integrate CO ₂ absorption on campus	Improve connection to Mekelpark
	Harvested material storage	→ Reuse existing materials	Improve indoor climate	Customisable and flexible spaces
	Material passport	→ Insight in materials present on campus	Replace outdated installations	Only add materials with a low environmental impact preferably biological
			Effective use of space	Design for disassembly
			Integrate energy production	Reuse existing structure

CO₂ neutral

program

TU Delft campus closed loop system

close local energy & material flows

flows

integrate energy production into urban design & architecture of the building

local reuse of existing materials

circularity

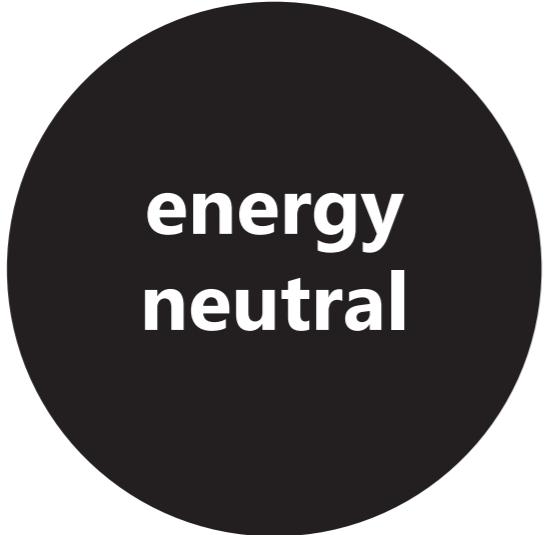

design for disassembly

use as many reused or biological materials

flexible and adaptable spaces

Materials	Service Life	Standards	Connections	Deconstruction
 Choose materials with properties that ensure they can be reused.	 Design the building with the whole lifetime of the building in mind.	 Design a simple building that fits into a 'larger context' system.	 Choose reversible connections that tolerate repeated assembly and disassembly.	 As well as creating a plan for construction, design the building for deconstruction.

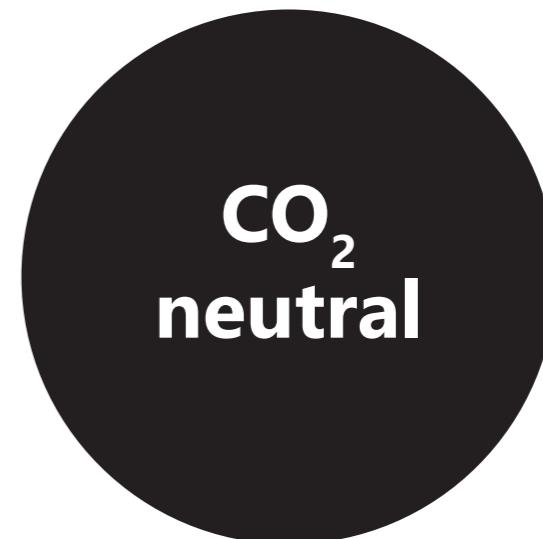

- reduce the energy demand
- increase Rc-value to 4,5 - 7 m²K/W
- produce energy with a renewable source
- smartly organise the program to create synergy

reuse existing structure and materials

stop using natural gas

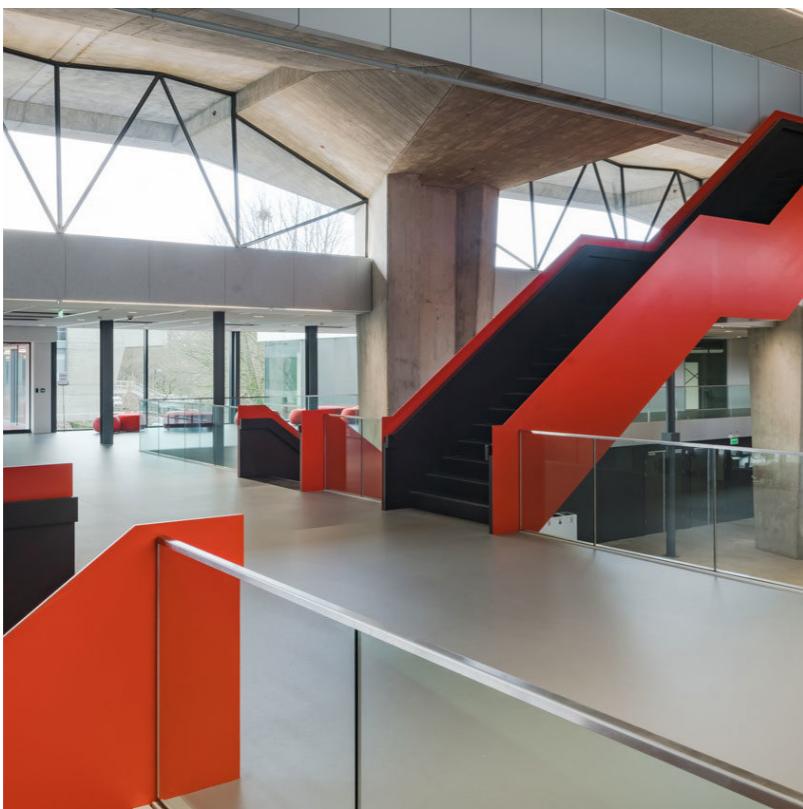

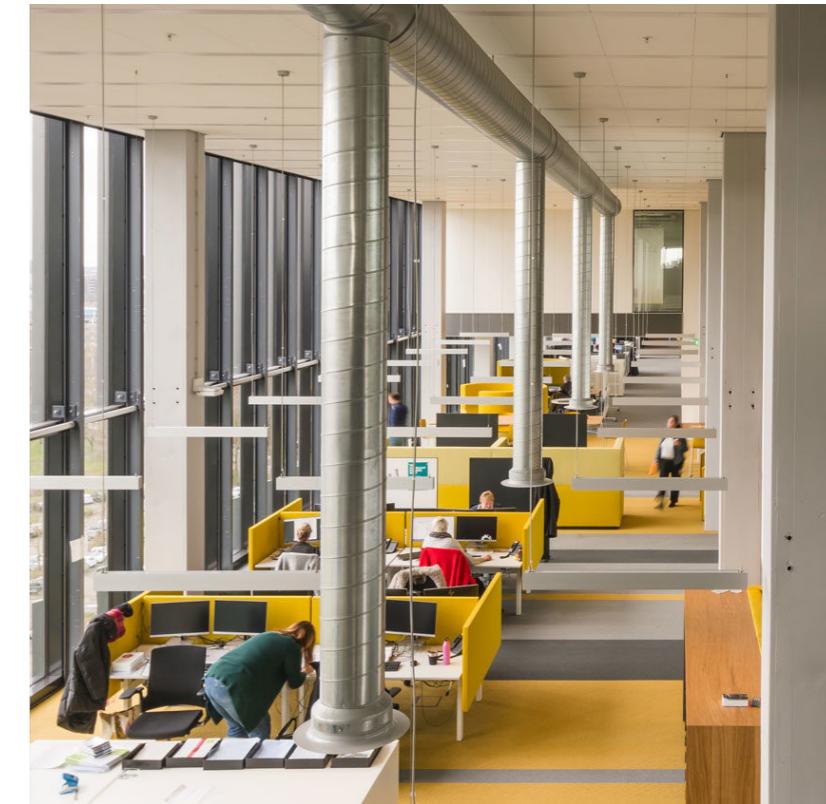

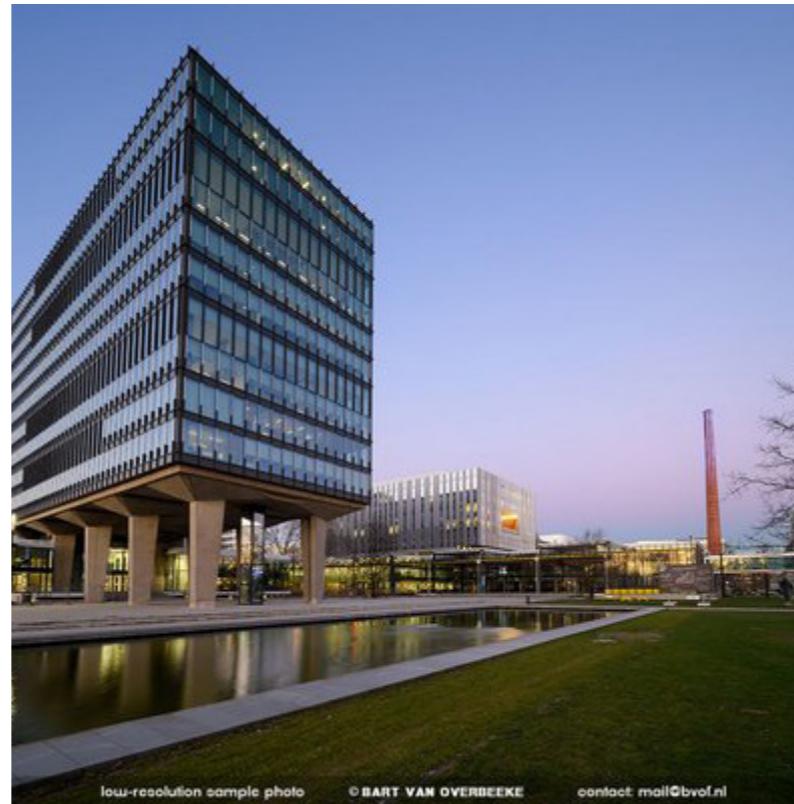

incorporate CO₂ absorption

when adding new materials choose ones with little
CO₂ emissions

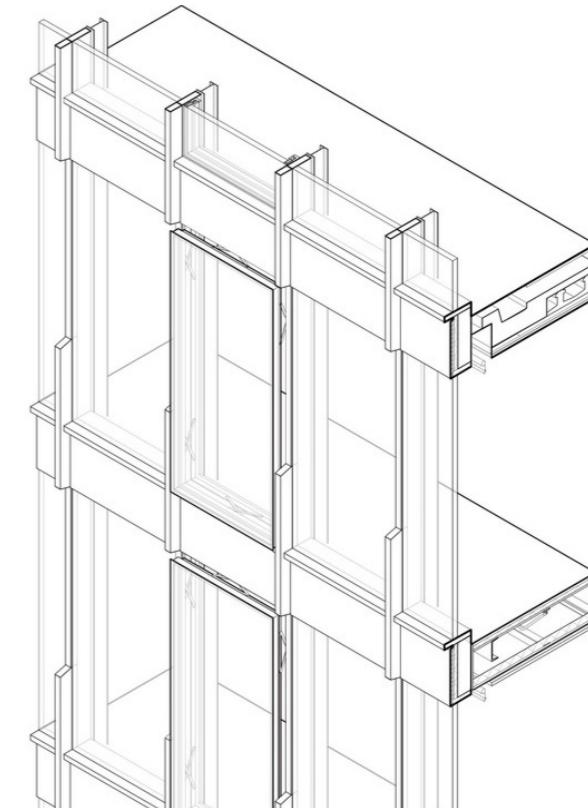

case studies

Atlas TU Eindhoven
Total Engineering Team
RSVP
Educational
2019
44.000 m²
Eindhoven, The
Netherlands

most sustainable education buildings in the world according to BREEAM
CO2 emissions have been reduced by around 80 percent while the number of users has more than doubled
campus-wide aquifer thermal energy storage system
retaining the steel facade construction
Smart Energy saving Lighting
Night cooling via automatic windows
