Water From Within

How to decrease inter-basin water-transfer
by enhancing Mexico City’s own potable water sources

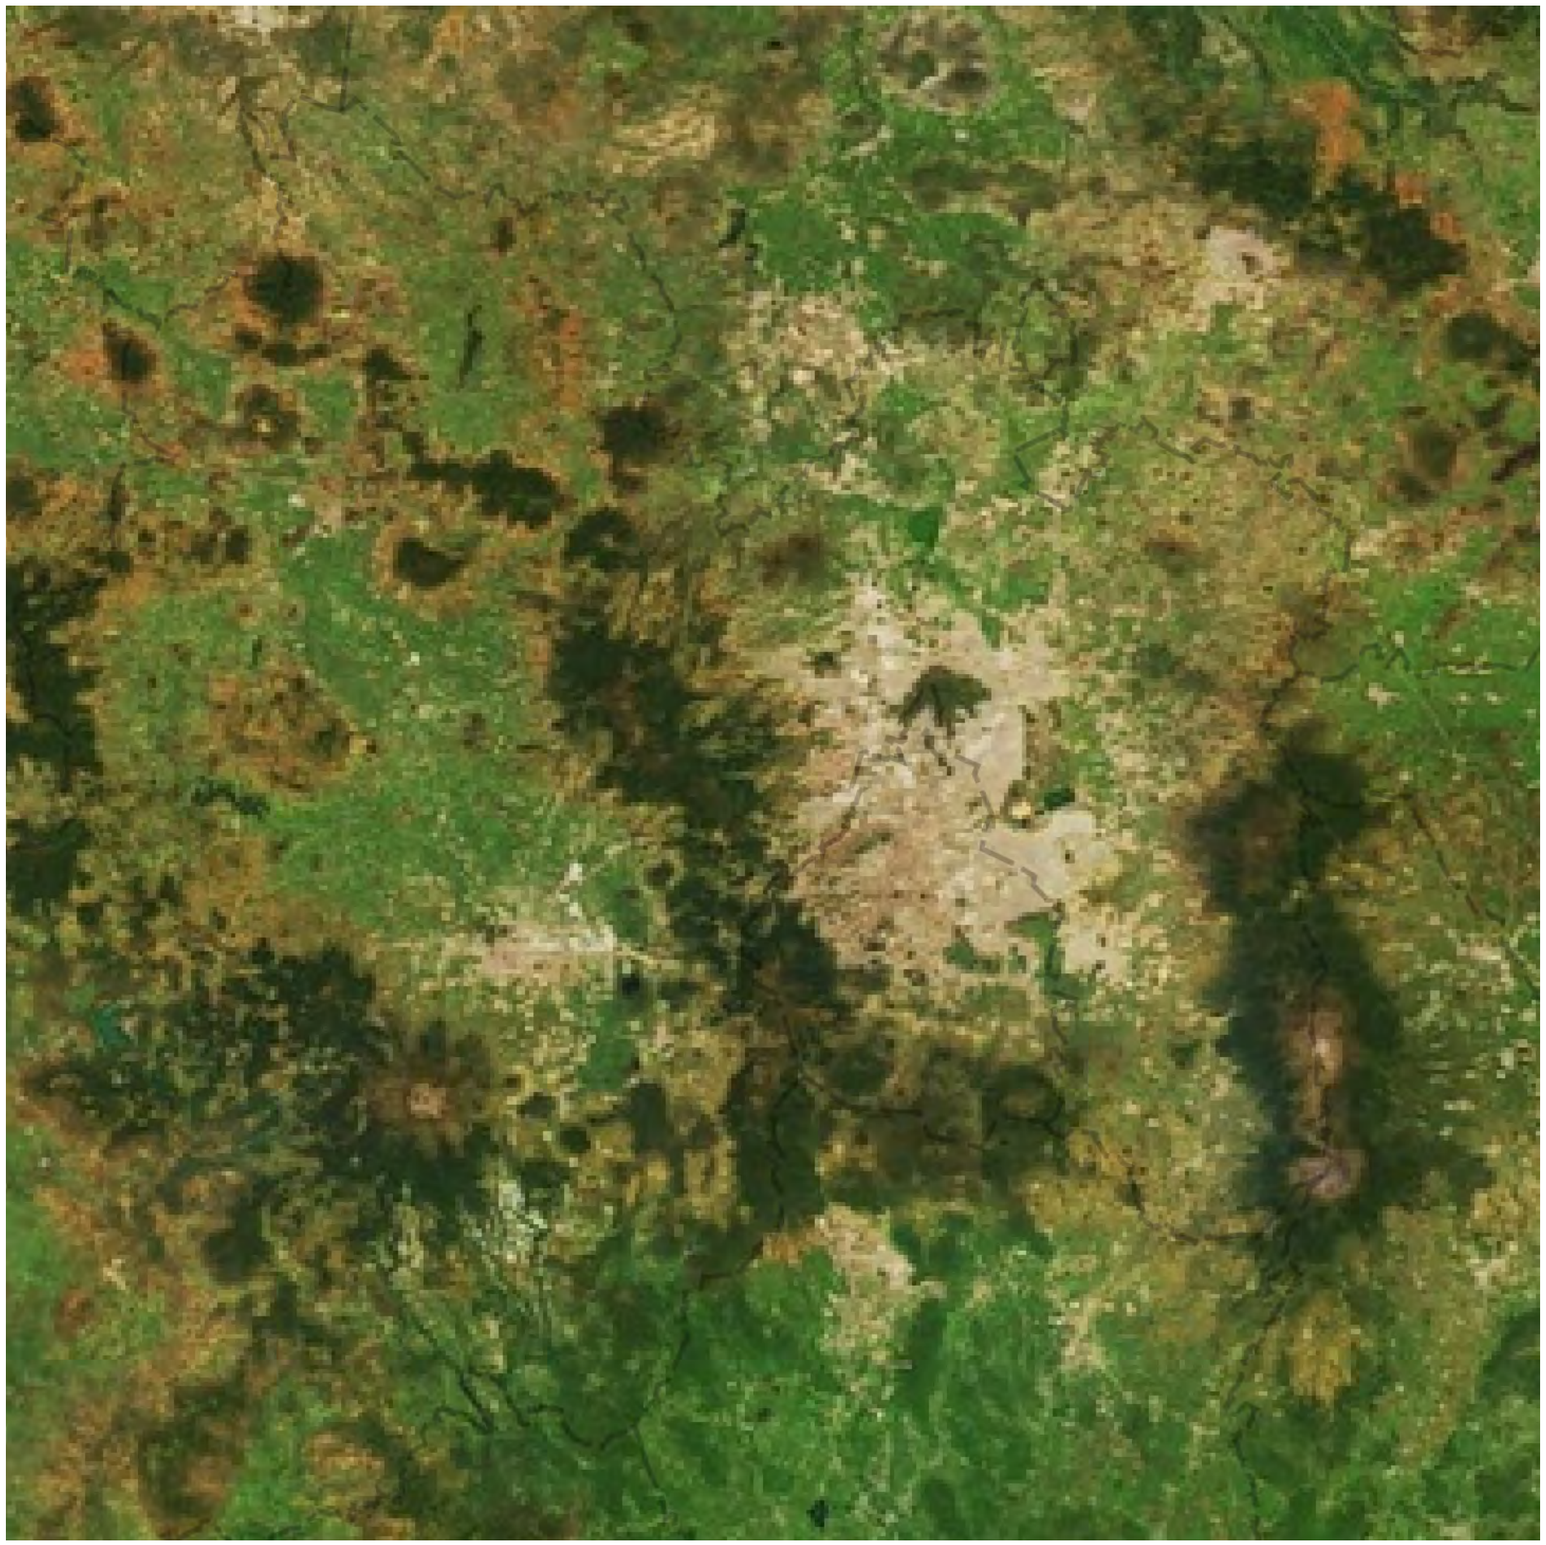
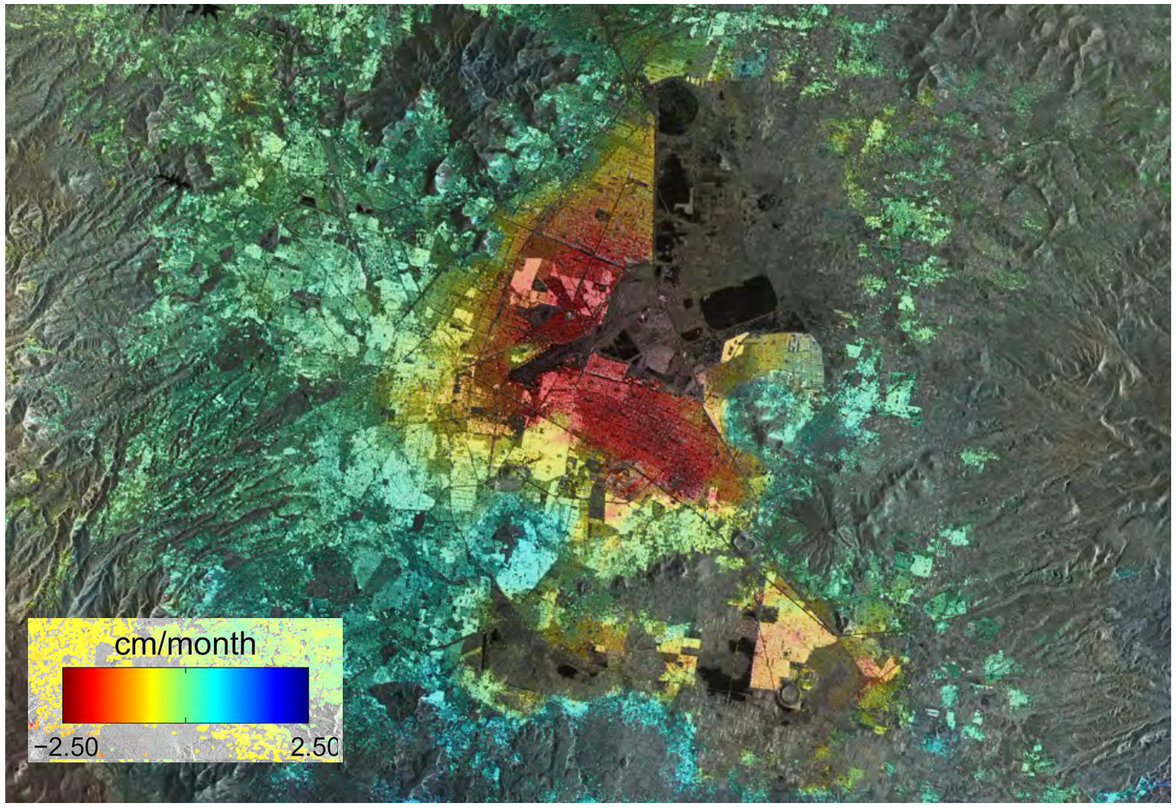
Future plans to expand the existing infrastructure
Increased water transfer & distribution line

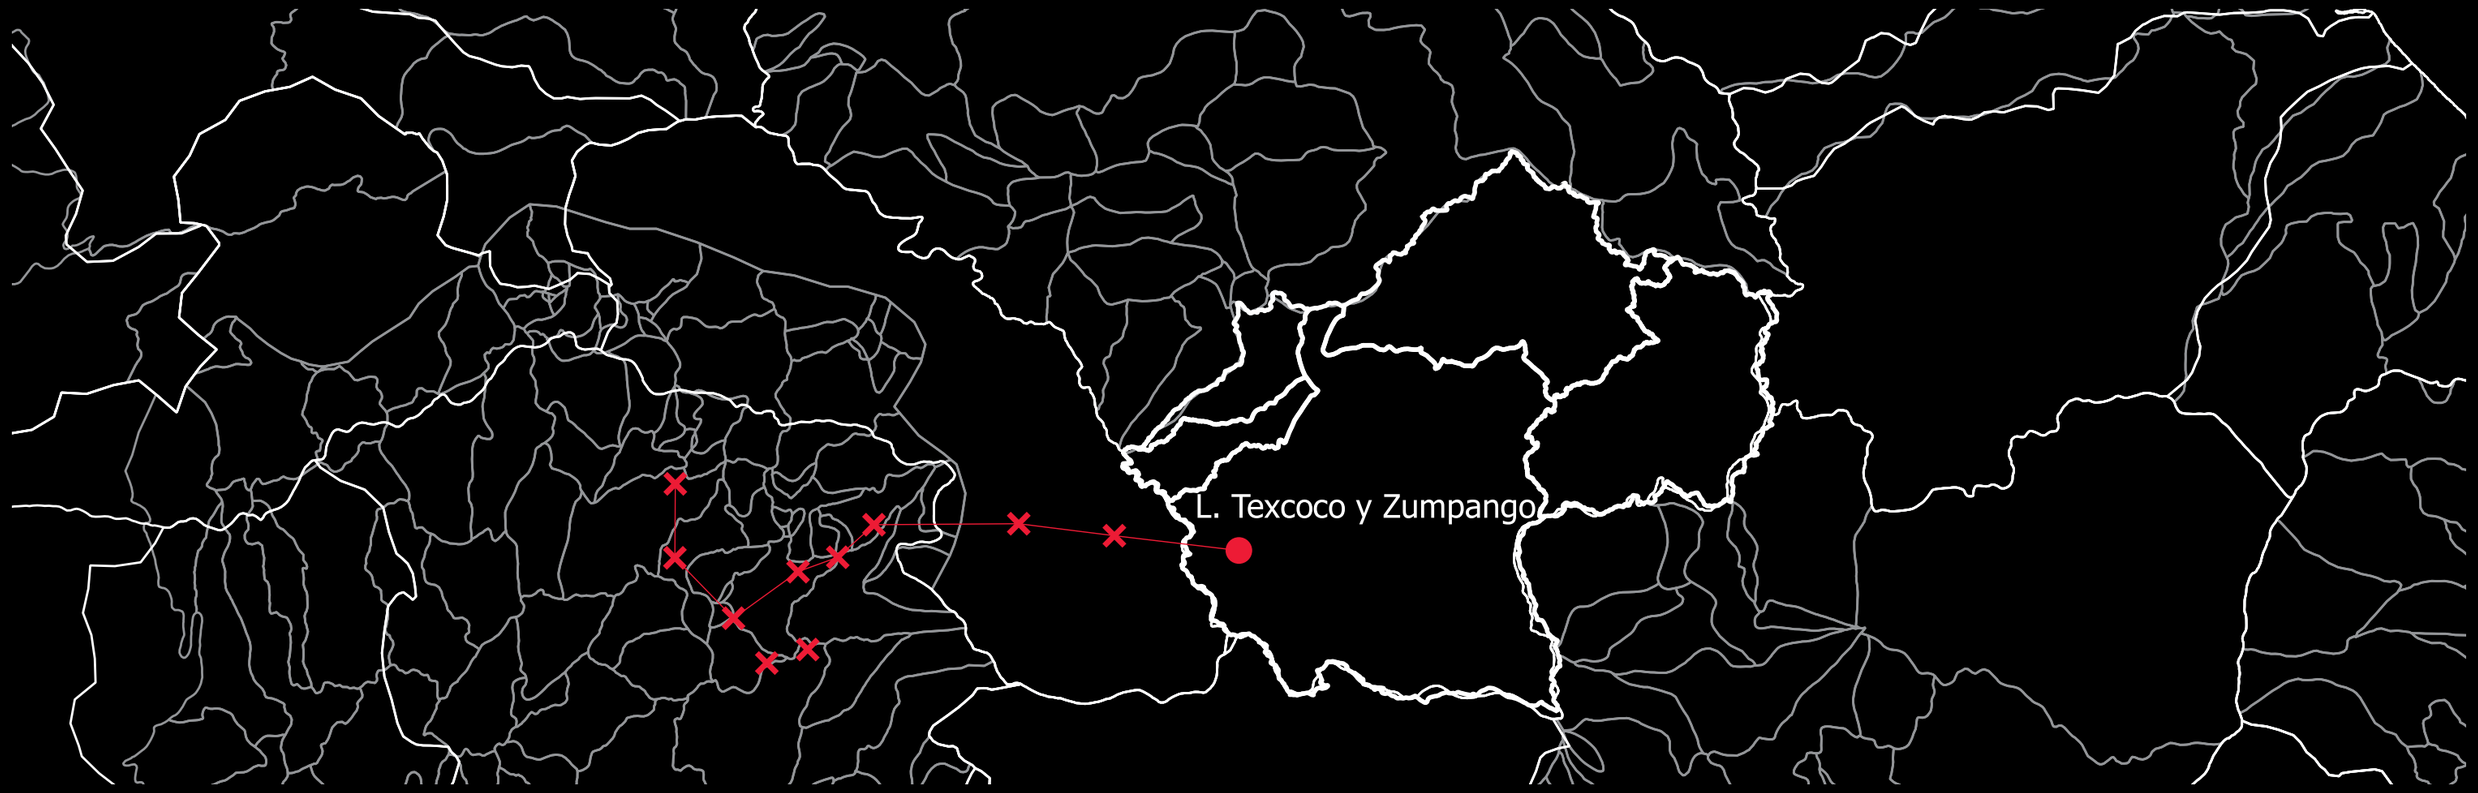


Inter-basin water transfer.
Ethical implication of current
water supply system

Inter-basin water transfer.
Ethical implication of current
water supply system



Can water sensitive urbanization in Mexico City's periphery help enhance the basin's own potable water sources in order to gradually decrease the need for inter-basin water transfer?

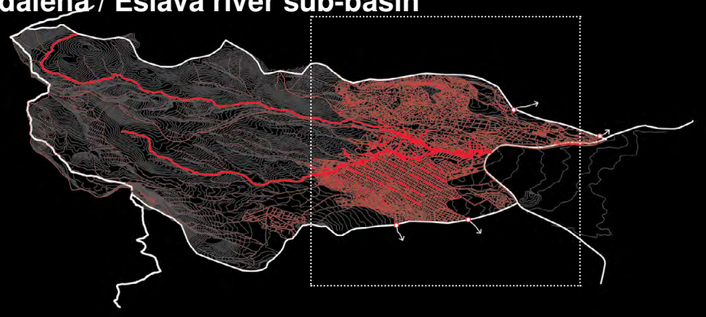


1.1 How can the basin become hydrologically autonomous?

1.1 Texcoco / Zumpango sub-basin

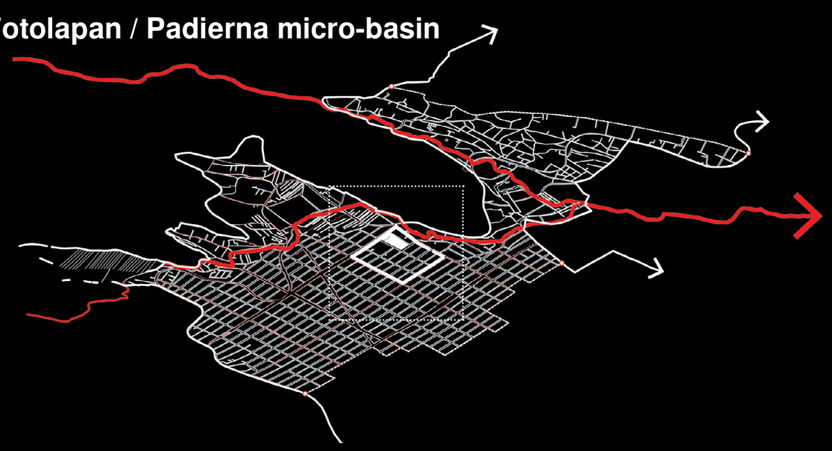
1.2 How can the mountainous region and transition zones help balance the aquifer recharge rate?

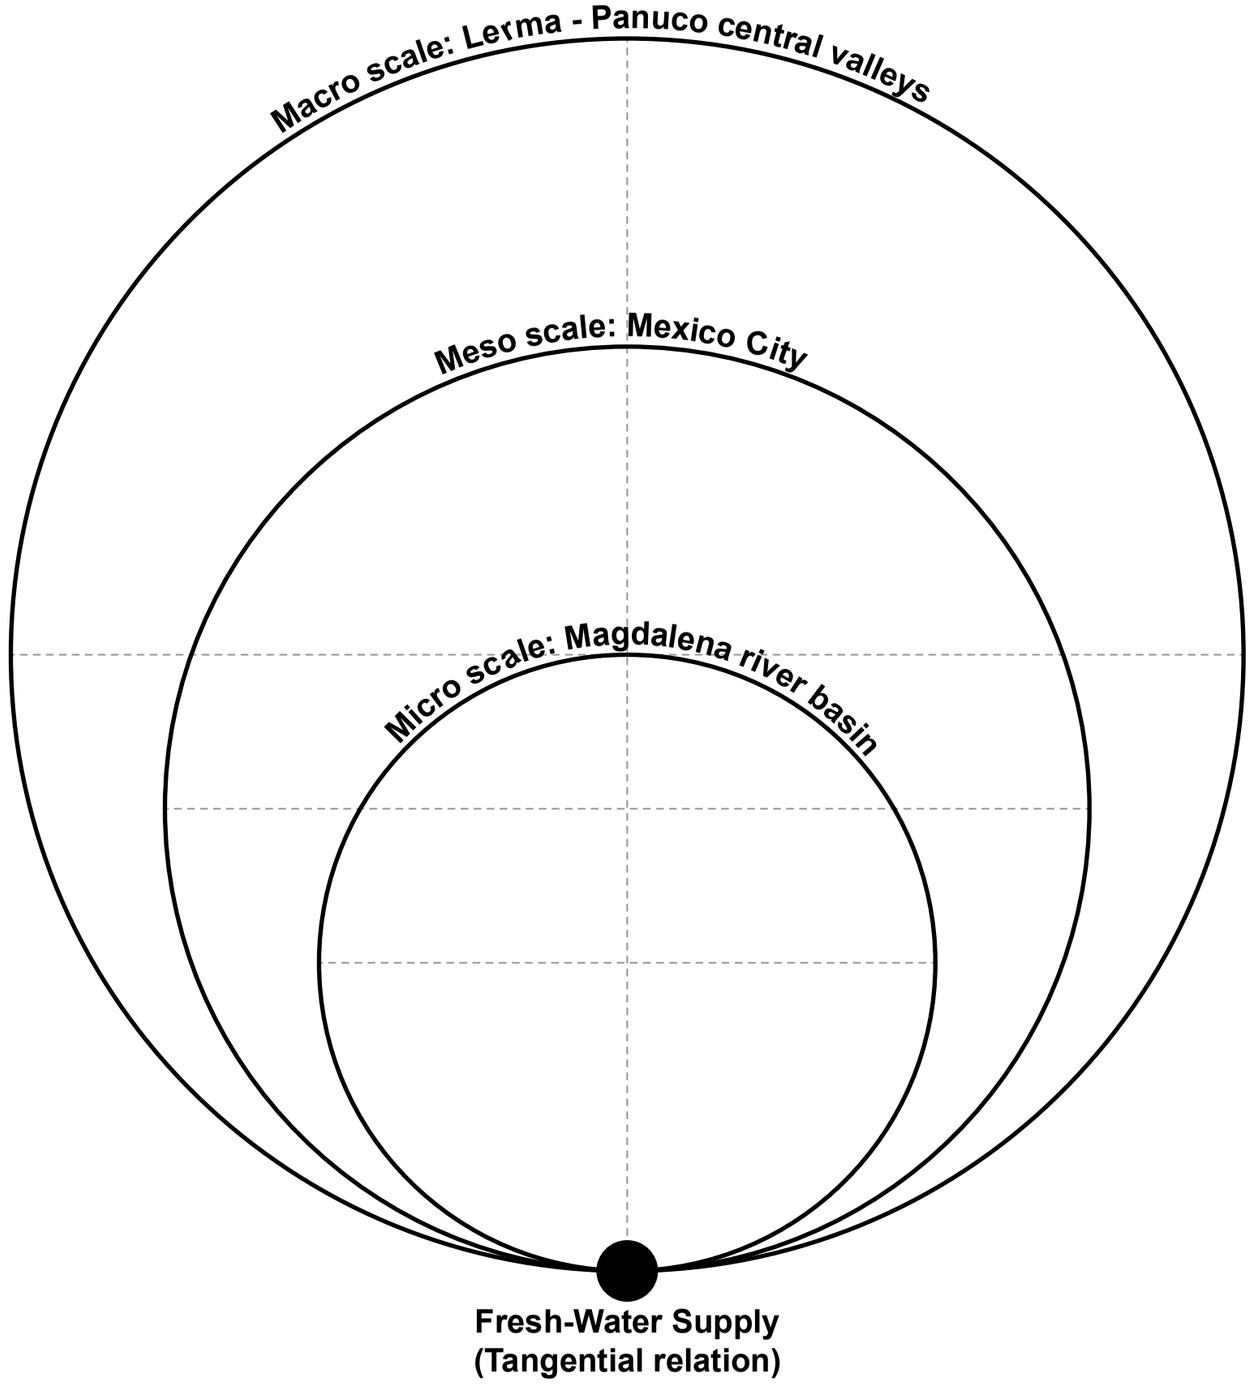
1.2 Magdalena / Eslava river sub-basin



1.3 How can water sensitive urbanization enhance existing potable water sources?

1.3 Totolapan / Padierna micro-basin





Macro scale: Lerma - Panuco central valleys
Meso scale: Mexico City
Micro scale: Magdalena river basin

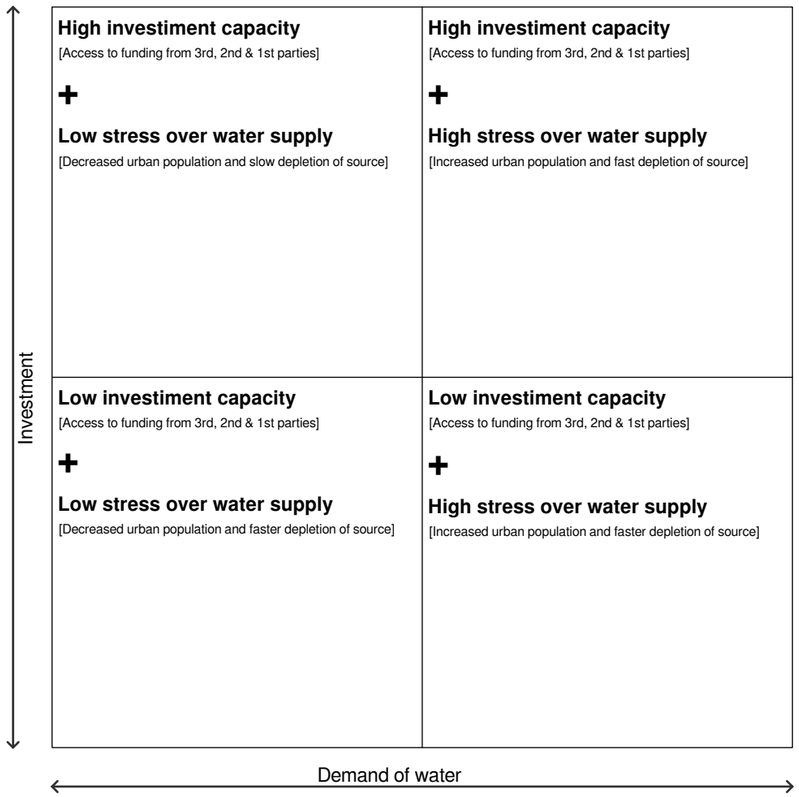
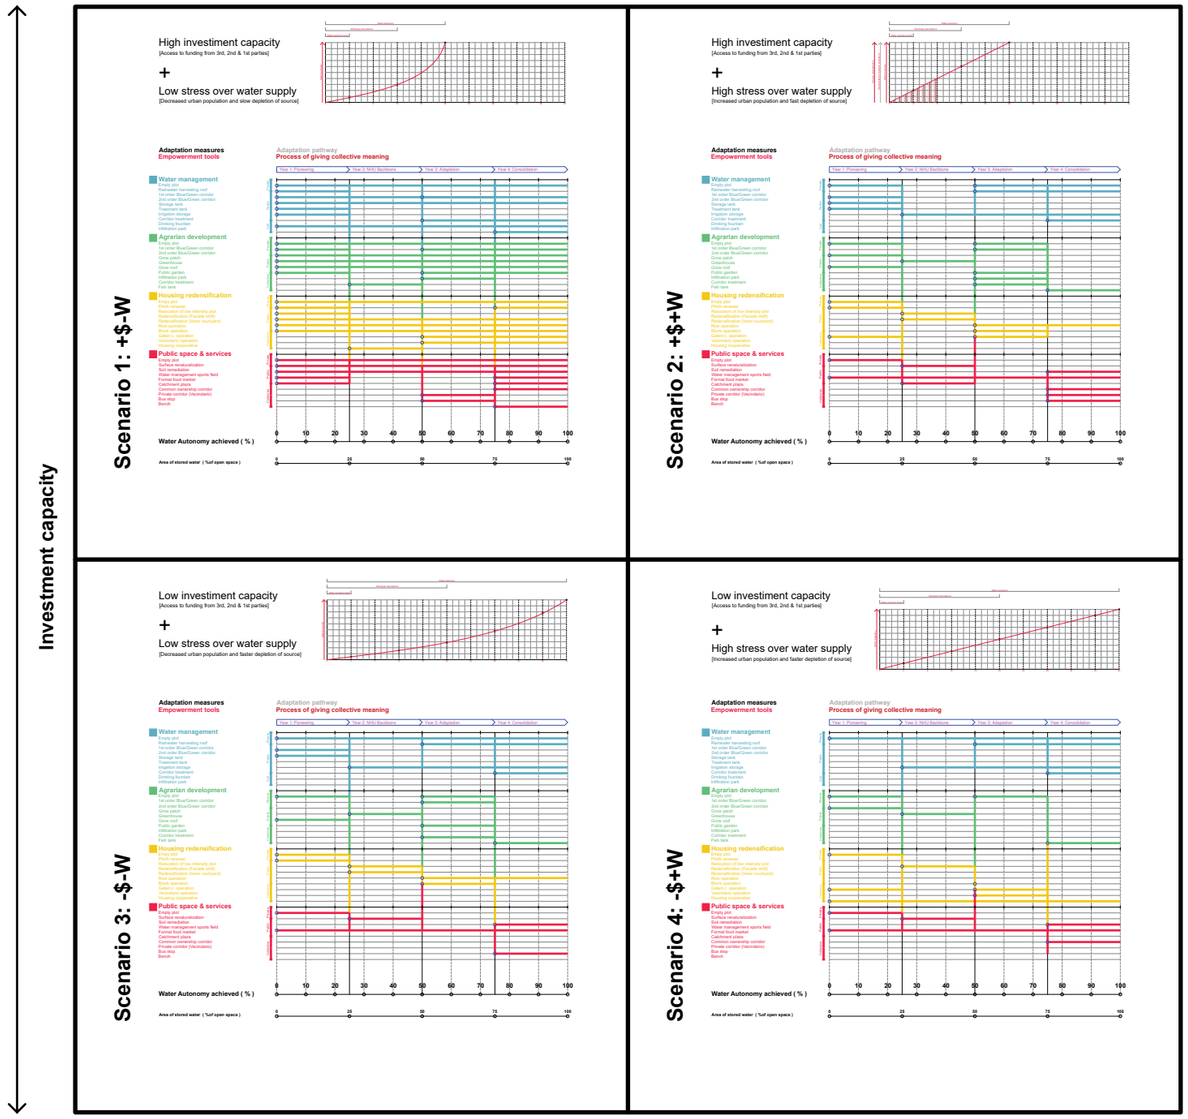
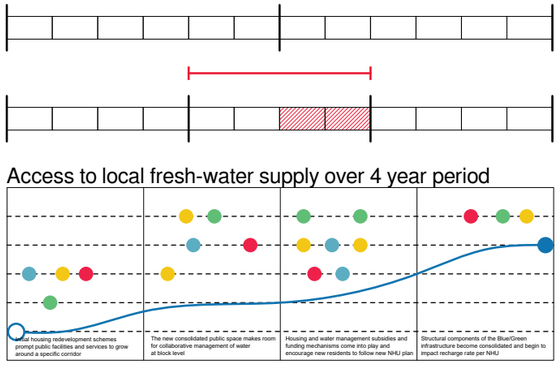
neighborhood collaboration



ADAPTATION PATHWAY PER SCENARIO



Demand for water



Access to local fresh-water supply over 4 year period
Initial housing redevelopment schemes prompt public facilities and services to grow around a specific corridor
The new consolidated public space makes room for collaborative management of water at block level
Housing and water management subsidies and funding mechanisms come into play and encourage new residents to follow new NHU plan
Structural components of the Blue/Green infrastructure become consolidated and begin to impact recharge rate per NHU

Water treatment strategy

MICRO

WATER TREATMENT INFRASTRUCTURE

Constraints	Enablers
-Poor solid waste management	-High rainfall

MESO

WATER RETENTION

Constraints	Enablers
-Highly densified	-Good soil mechanics

MACRO

GROUNDWATER RECHARGE

Constraints	Enablers
-Degraded soil quality	-Highly infiltratable soil

Health and Food production strategy

MICRO

LOCAL FOOD PRODUCTION

Constraints	Enablers
-Short rainy seasons	-Highly productive landscape

MESO

RENATURALIZE URBAN PERIPHERY

Constraints	Enablers
-Increasing housing market	-Strong existing green network

MACRO

DECREASE URBAN SPRAWL

Constraints	Enablers
-Increasing population de to immigration from rural areas	-Good preservation of forests and natural areas

Housing regen. strategy

MICRO

HOUSING REDENSIFICATION

Constraints	Enablers
-Competition for housing market is highly monopolized	-Financial incentives from SEDUVI

MESO

COOPERATIVE HOUSING SCHEME

Constraints	Enablers
-Lack of community organi-zation	-Well knit community

MACRO

REDISTRIBUTION OF URBAN DENSITY

Constraints	Enablers
-Strict zoning laws	-Pressure from federal fund-ing programs

Public space and services strategy

MICRO

PUBLIC SPACE REGENERATION

Constraints	Enablers
-Low maintainance budget	-High demand

MESO

DECENTRALIZATION OF PUBLIC SERVICES

Constraints	Enablers
-High demand of services	-Abundant informal services

MACRO

CREATION OF STRONG LOCAL ECONOMY

Constraints	Enablers
-Large scale monopolies	-Distance is favorable

Housing strategy

Neighbor cooperation to ensure correct urban water treatment

Water treatment infrastructure

Conclusions

Conclusion 01: Water autonomy may not be reached,
but population can still be benefited

Conclusion 02: Community appropriation enables continuity

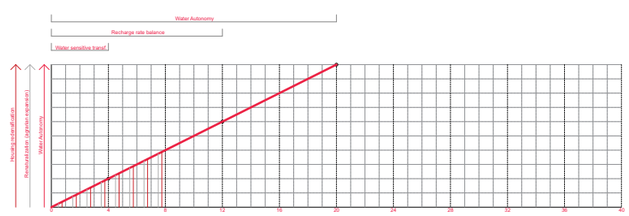
Conclusion 03: Planning culture must permeate public institutions

Conclusion 04: Short term actions can create a path dependency for long term objectives

High investiment capacity
[Access to funding from 3rd, 2nd & 1st parties]

+

High stress over water supply
[Increased urban population and fast depletion of source]



Scenario 2: +$+W

Adaptation measures
Empowerment tools

Water management
- Empty plot
- Rainwater harvesting roof
- 1st order Blue/Green corridor
- 2nd order Blue/Green corridor
- Storage tank
- Treatment tank
- Irrigation storage
- Corridor treatment
- Drinking fountain
- Infiltration park

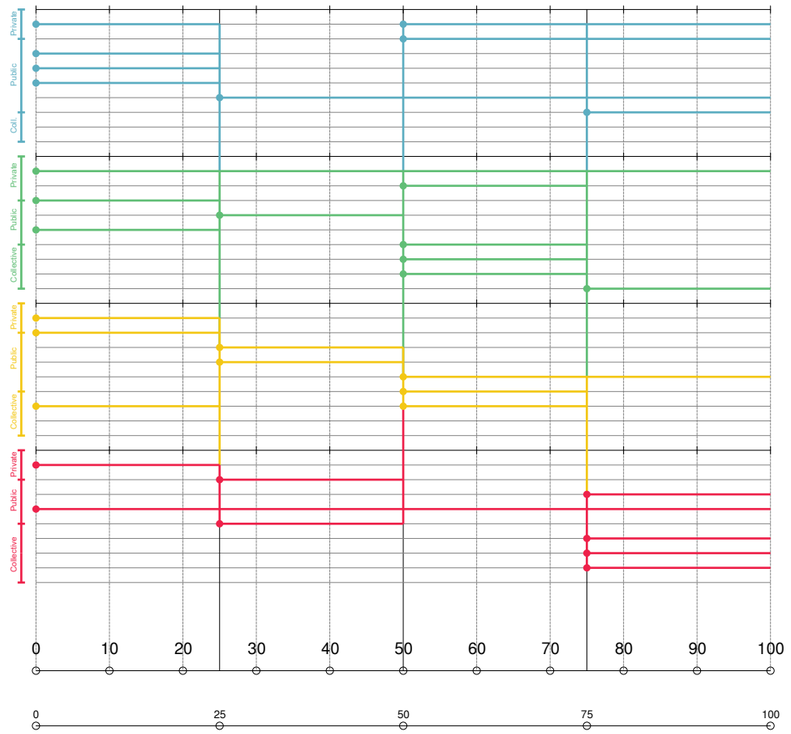
Agrarian development
- Empty plot
- 1st order Blue/Green corridor
- 2nd order Blue/Green corridor
- Grow patch
- Greenhouse
- Grow roof
- Public garden
- Infiltration park
- Corridor treatment
- Fish tank

Housing redensification
- Empy plot
- Plinth renewal
- Relocation of low intensity plot
- Redensification (Facade shift)
- Redensification (Inner courtyard)
- Row operation
- Block operation
- Gated c. operation
- Vecindario operation
- Housing cooperative

Public space & services
- Empty plot
- Surface renaturalization
- Soil remediation
- Water management sports field
- Formal food market
- Catchment plaza
- Common ownership corridor
- Private corridor (Vecindario)
- Bus stop
- Bench

Adaptation pathway
Process of giving collective meaning

Year 1: Pioneering | Year 2: NHU Backbone | Year 3: Adaptation | Year 4: Consolidation



Water Autonomy achieved (%)

0 10 20 30 40 50 60 70 80 90 100

Area of stored water (% of open space)

0 25 50 75 100

Further direction of the research

Further steps

FEDERAL FUNDS:
Food security and public health program

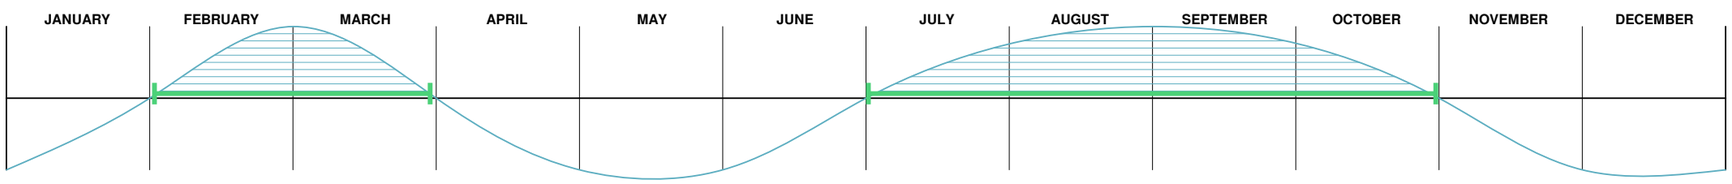
Funds for becoming a certified organic food producer (SEMARNAT)

FEDERAL FUNDS:
Water treatment program

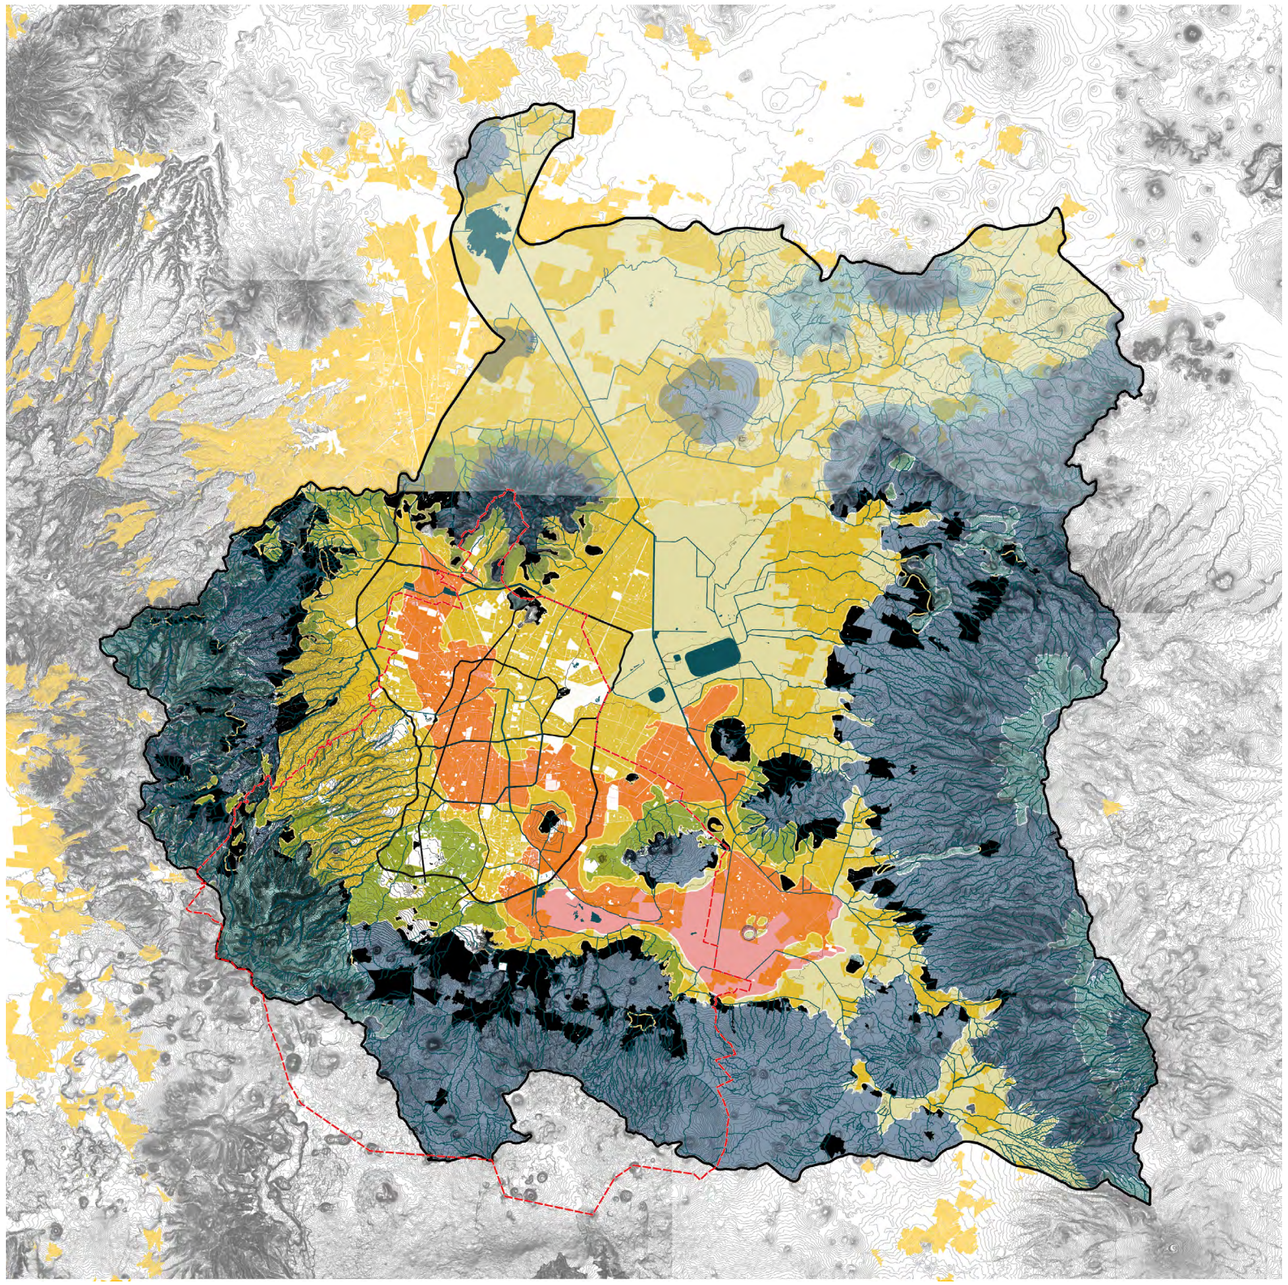
Funds for returning clean water to the municipality (CONAGUA)

FEDERAL FUNDS:
Sustainable rural development programs

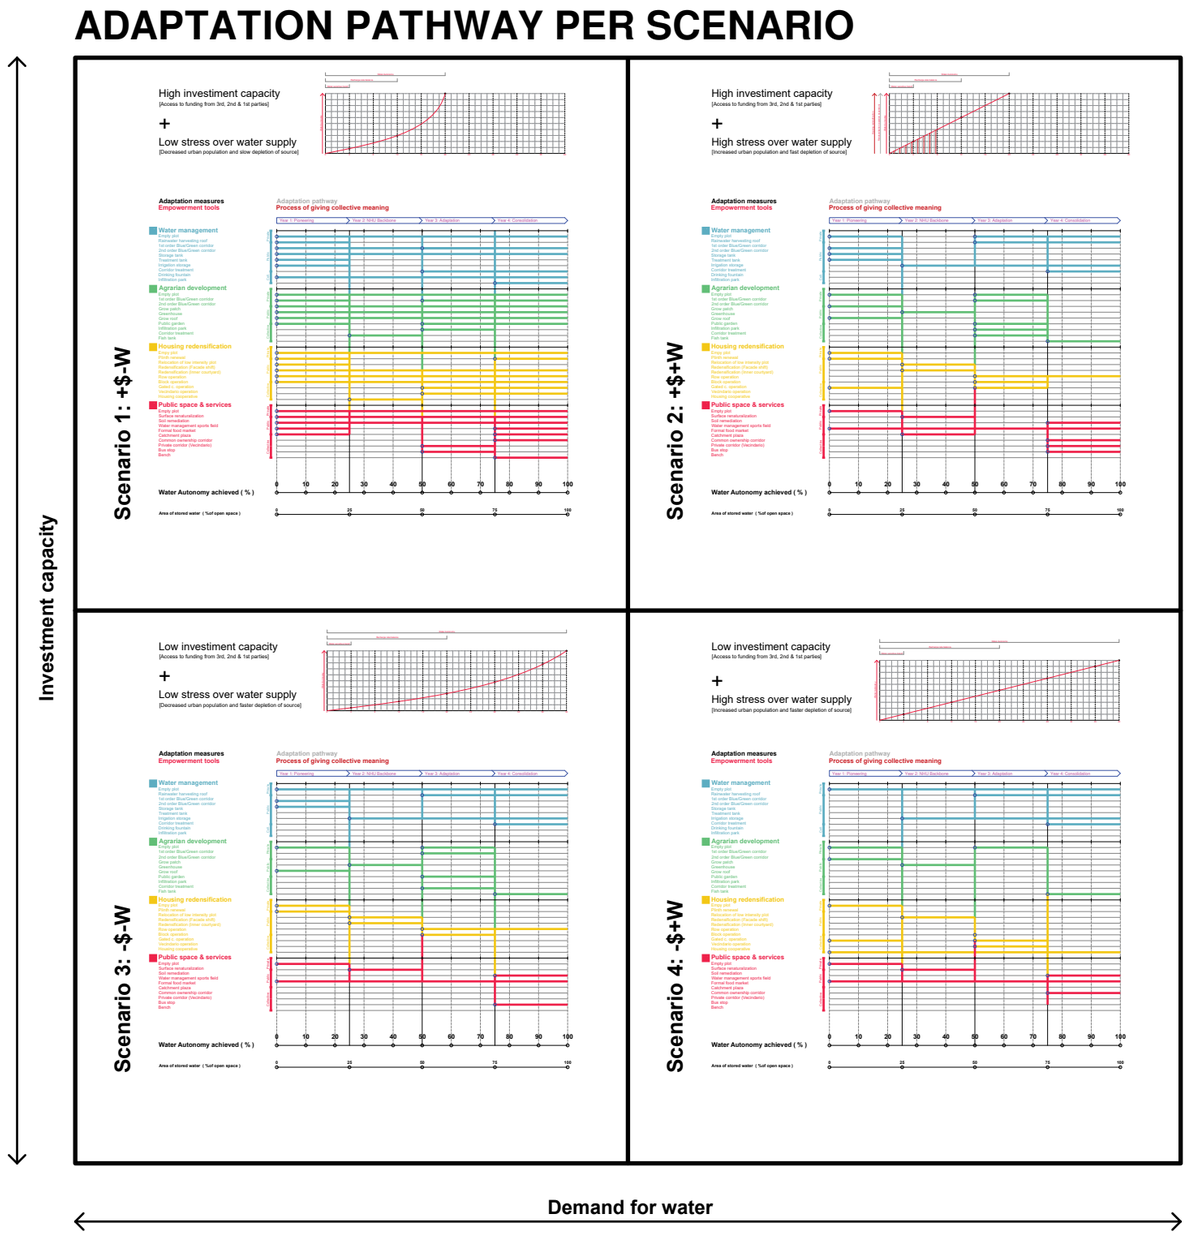
Funds for infrastructure construction and training (APARURAL)



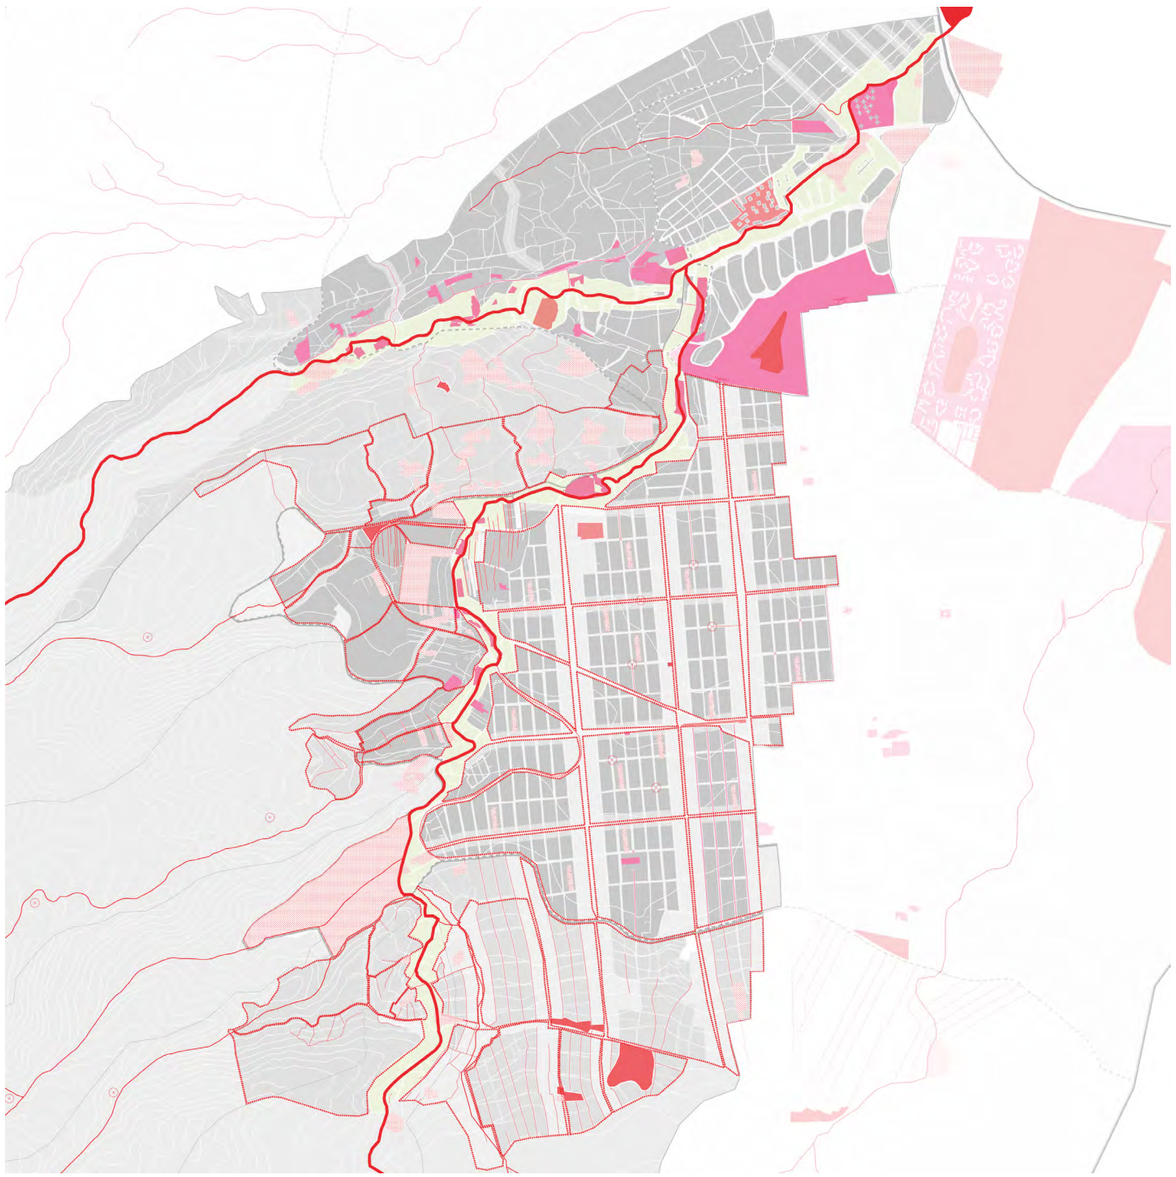
Further steps



Further steps



Further steps



Recommendation 01: Water autonomy may not be reached, but population can be benefit ed

Recommendation 02: Sub & Micro-basin level council groups should be established
