

Designing for Coexistence

or how to overcome the speciesistic bias in spatial design

1.2 million species known to us

8.7 million species estimated

1 million species threatened by extinction

How can spatial design be implemented in order to improve the coexistence between species?

What is coexistence?

What moral obligations do designers have towards non-human beings?

What are the basic things that species need in their environment and how are human structures and activities affecting these needs for non-human species?

What species are living in the Thames Estuary and what are their basic needs of their environment?

What effects has the current design of the Thames Estuary on the species and how is it contributing to their needs?

How can the species' needs be taken into account in the current situation of the Thames Estuary in order to improve the coexistence between species?

(NASA, 2003)

Effects of the urban habitat

Approach

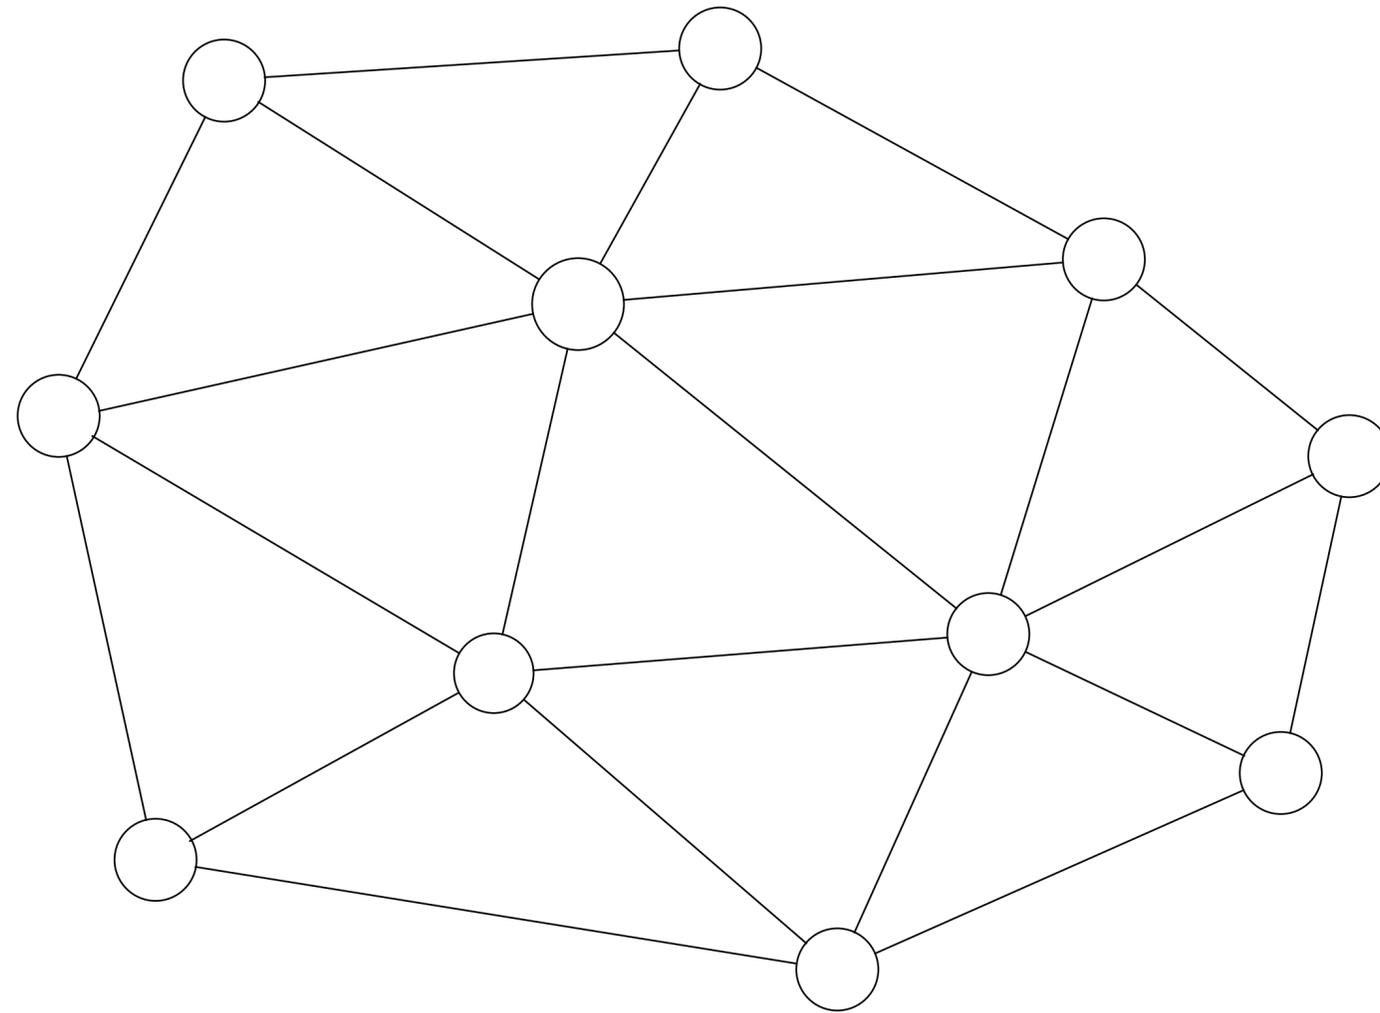

Analysis

Design

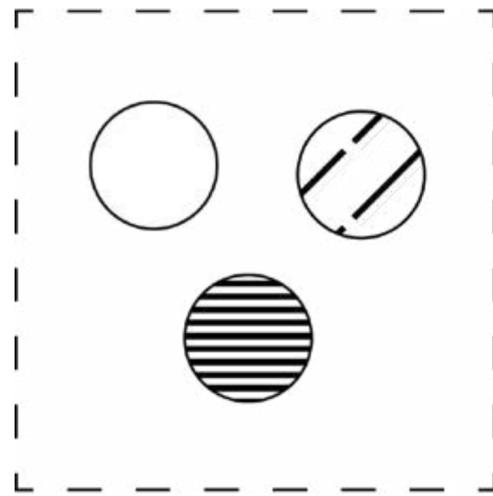

Conclusion

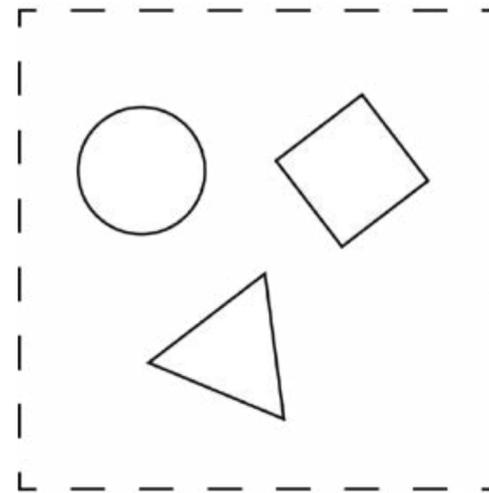

to exist = to coexist

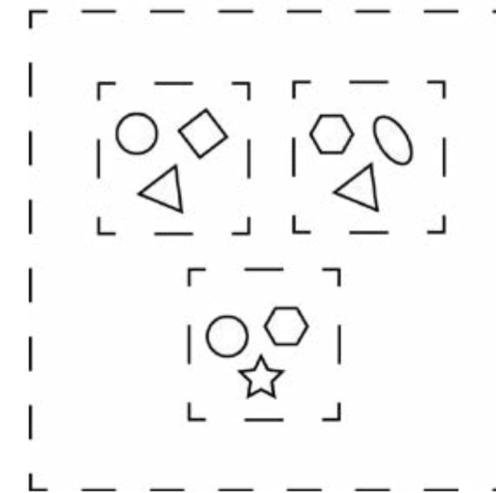

networks

genetic diversity

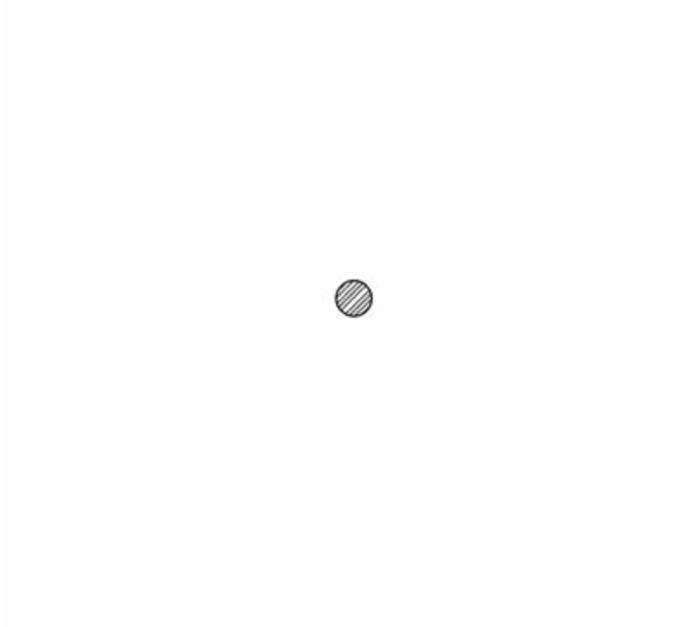

species diversity

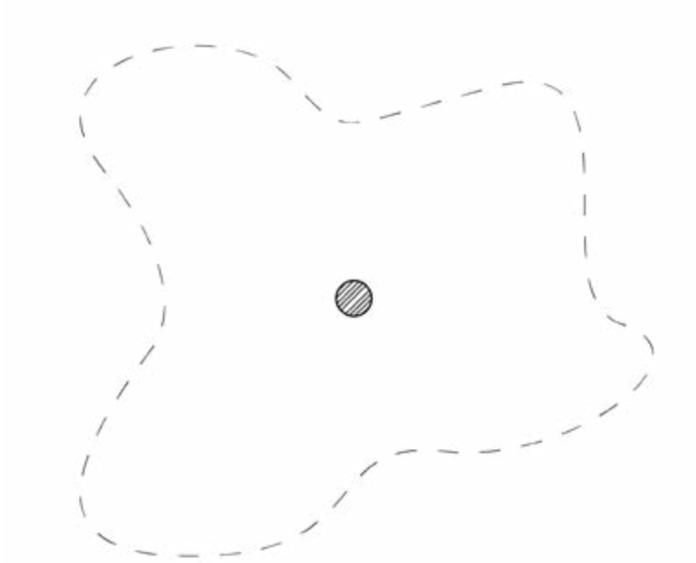

ecosystem diversity

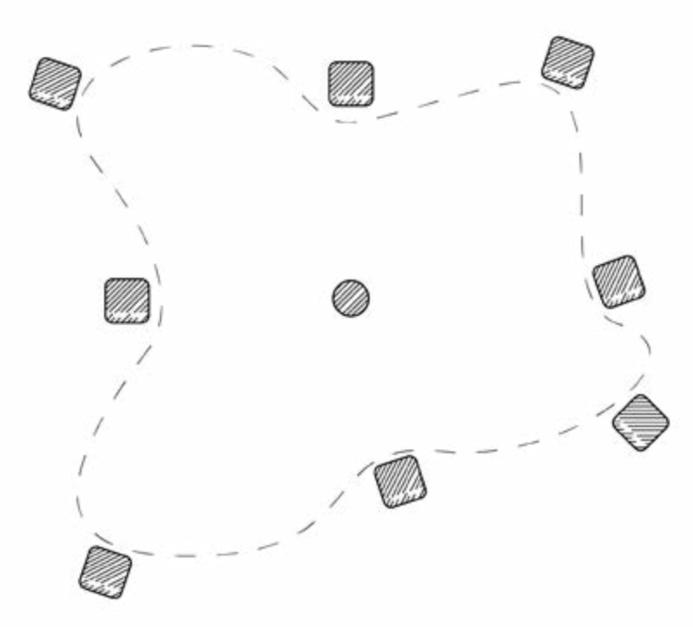

biodiversity as the richness of coexistence that offers resilience

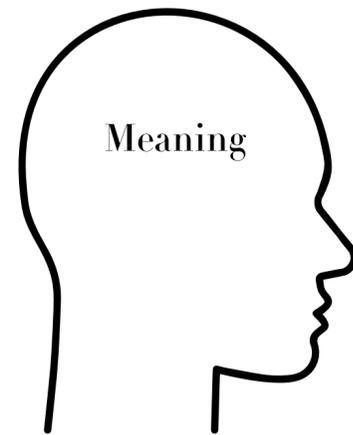

Subject

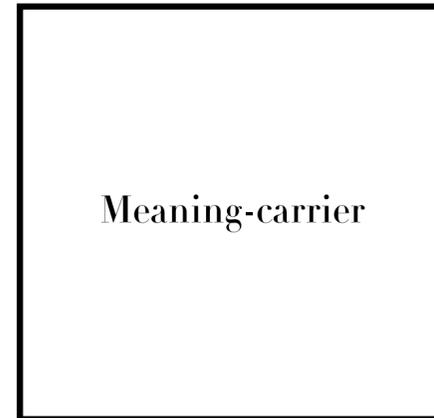

... in an environment

... consisting of objects

Subject

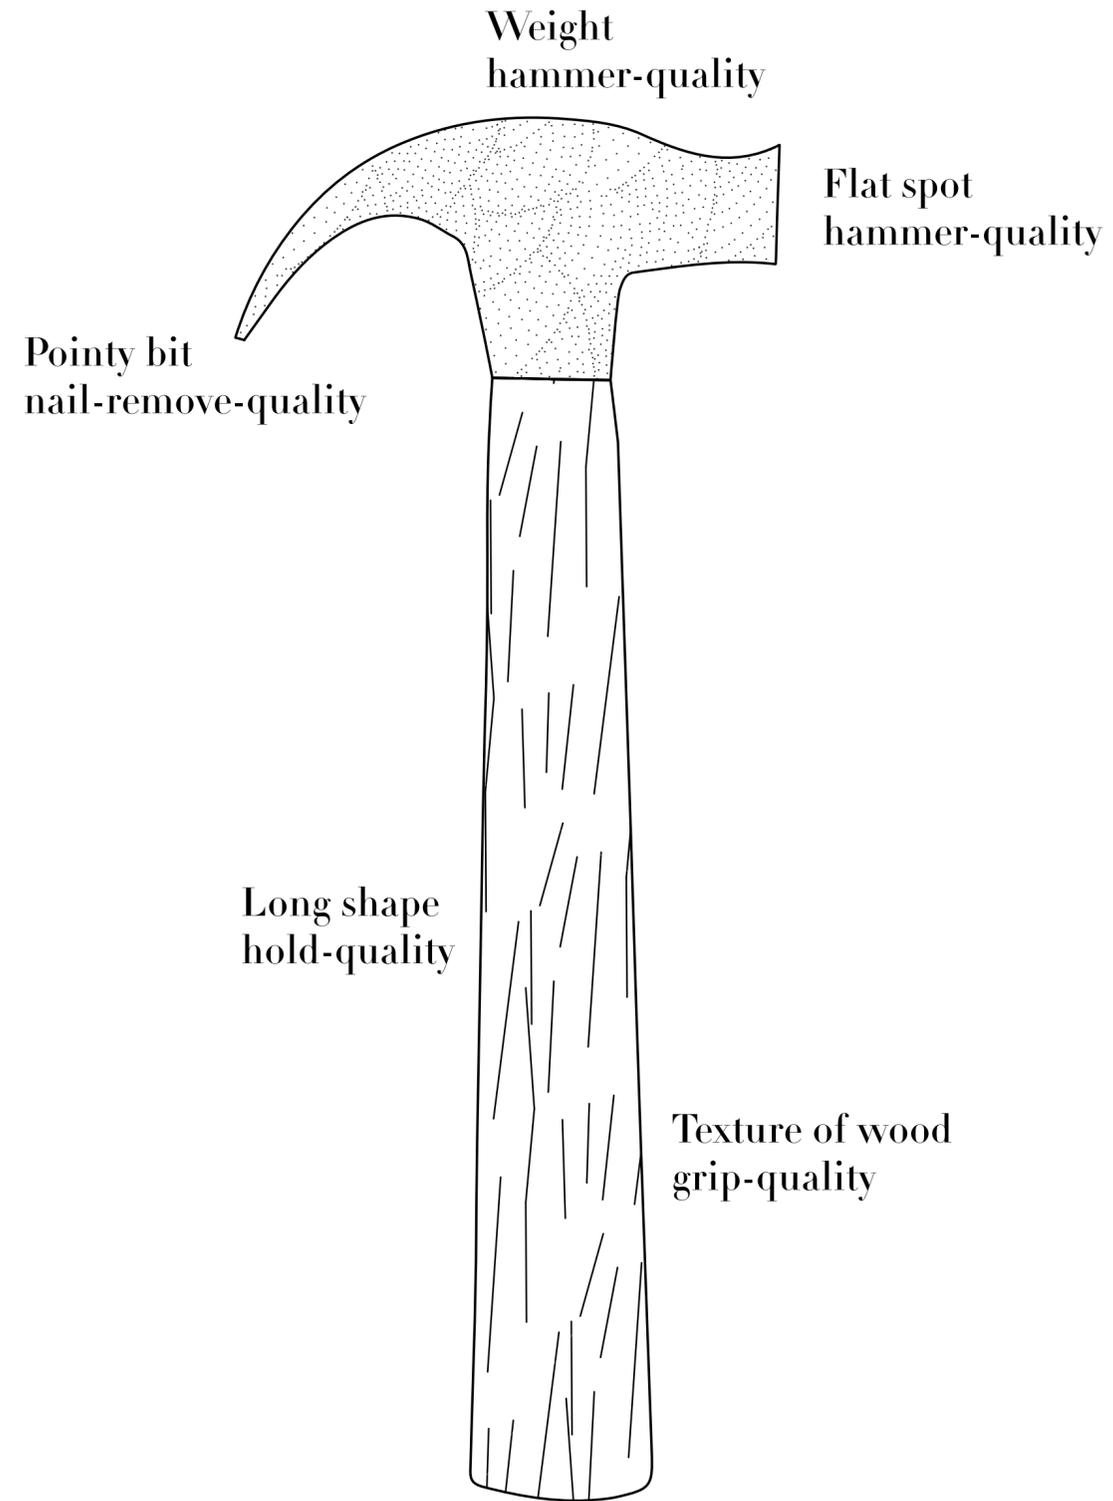

Object

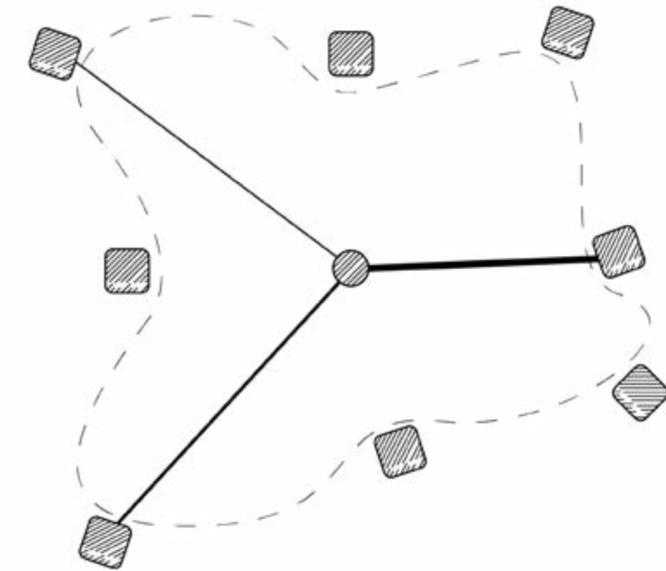

texture

[teks-cher]
(noun)

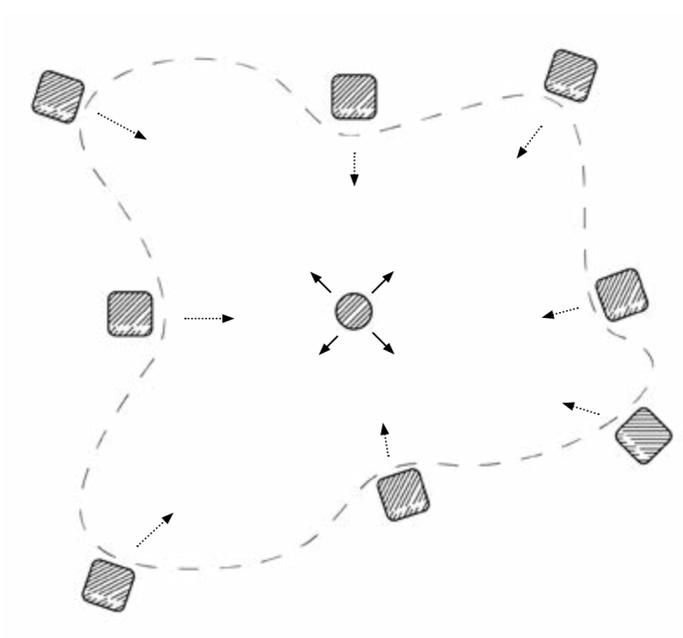

the characteristic physical structure given to a material, an object, etc., by the size, shape, arrangement, and proportions of its parts.

How can spatial design be implemented in order to improve the coexistence between species?

How can spatial design be implemented in order to improve the coexistence between species?

in order to improve coexistence we have to improve biodiversity

land use that limits agency of other species limits biodiversity

start seeing human environments as part of a dynamic ecosystem that changes over time

allowing other species to design with us
