

MOVING BIOCOMPOSITES INTO SECOND GEAR

Exploring the potential of long fibre biocomposites in the mobility and transport industry

Although biocomposites have been around for some years now, their use is still far from mainstream. Yet, the material properties of biocomposites and their current applications show a lot of potential for more sustainable, lightweight and structural applications in many industries. This project explored the potential of long fibre biocomposites in the mobility and transport industry by collaborating with six companies. The initial aim to find and develop an application for one of the companies turned out to be a very ambitious goal in the slow world of material innovation.

So instead, several improvements in the project acquisition process of NPSP have been developed in this project. Additional website pages aim to guide potential clients in contacting NPSP in a structured manner and a new sample set is developed to show 'all NPSP has to offer' in one comprehensive box. Implementing these improvements should improve the credibility of NPSP and the materials for larger industries, taking biocomposites one step closer to mainstream adoption.
