The closed off space

a disconnect that we don't notice/isolation

Scale

the human and the machine

humans replaced by machines

Efficiency and Automatisatation

: an action designed to achieve efficiency. :

the ability to achieve an end goal with little to no waste, effort, or energy.

But for whom?

‘The biggest business that you know nothing about’
a business - to - business to industry

the closed off space

MEGASTRUCTURES

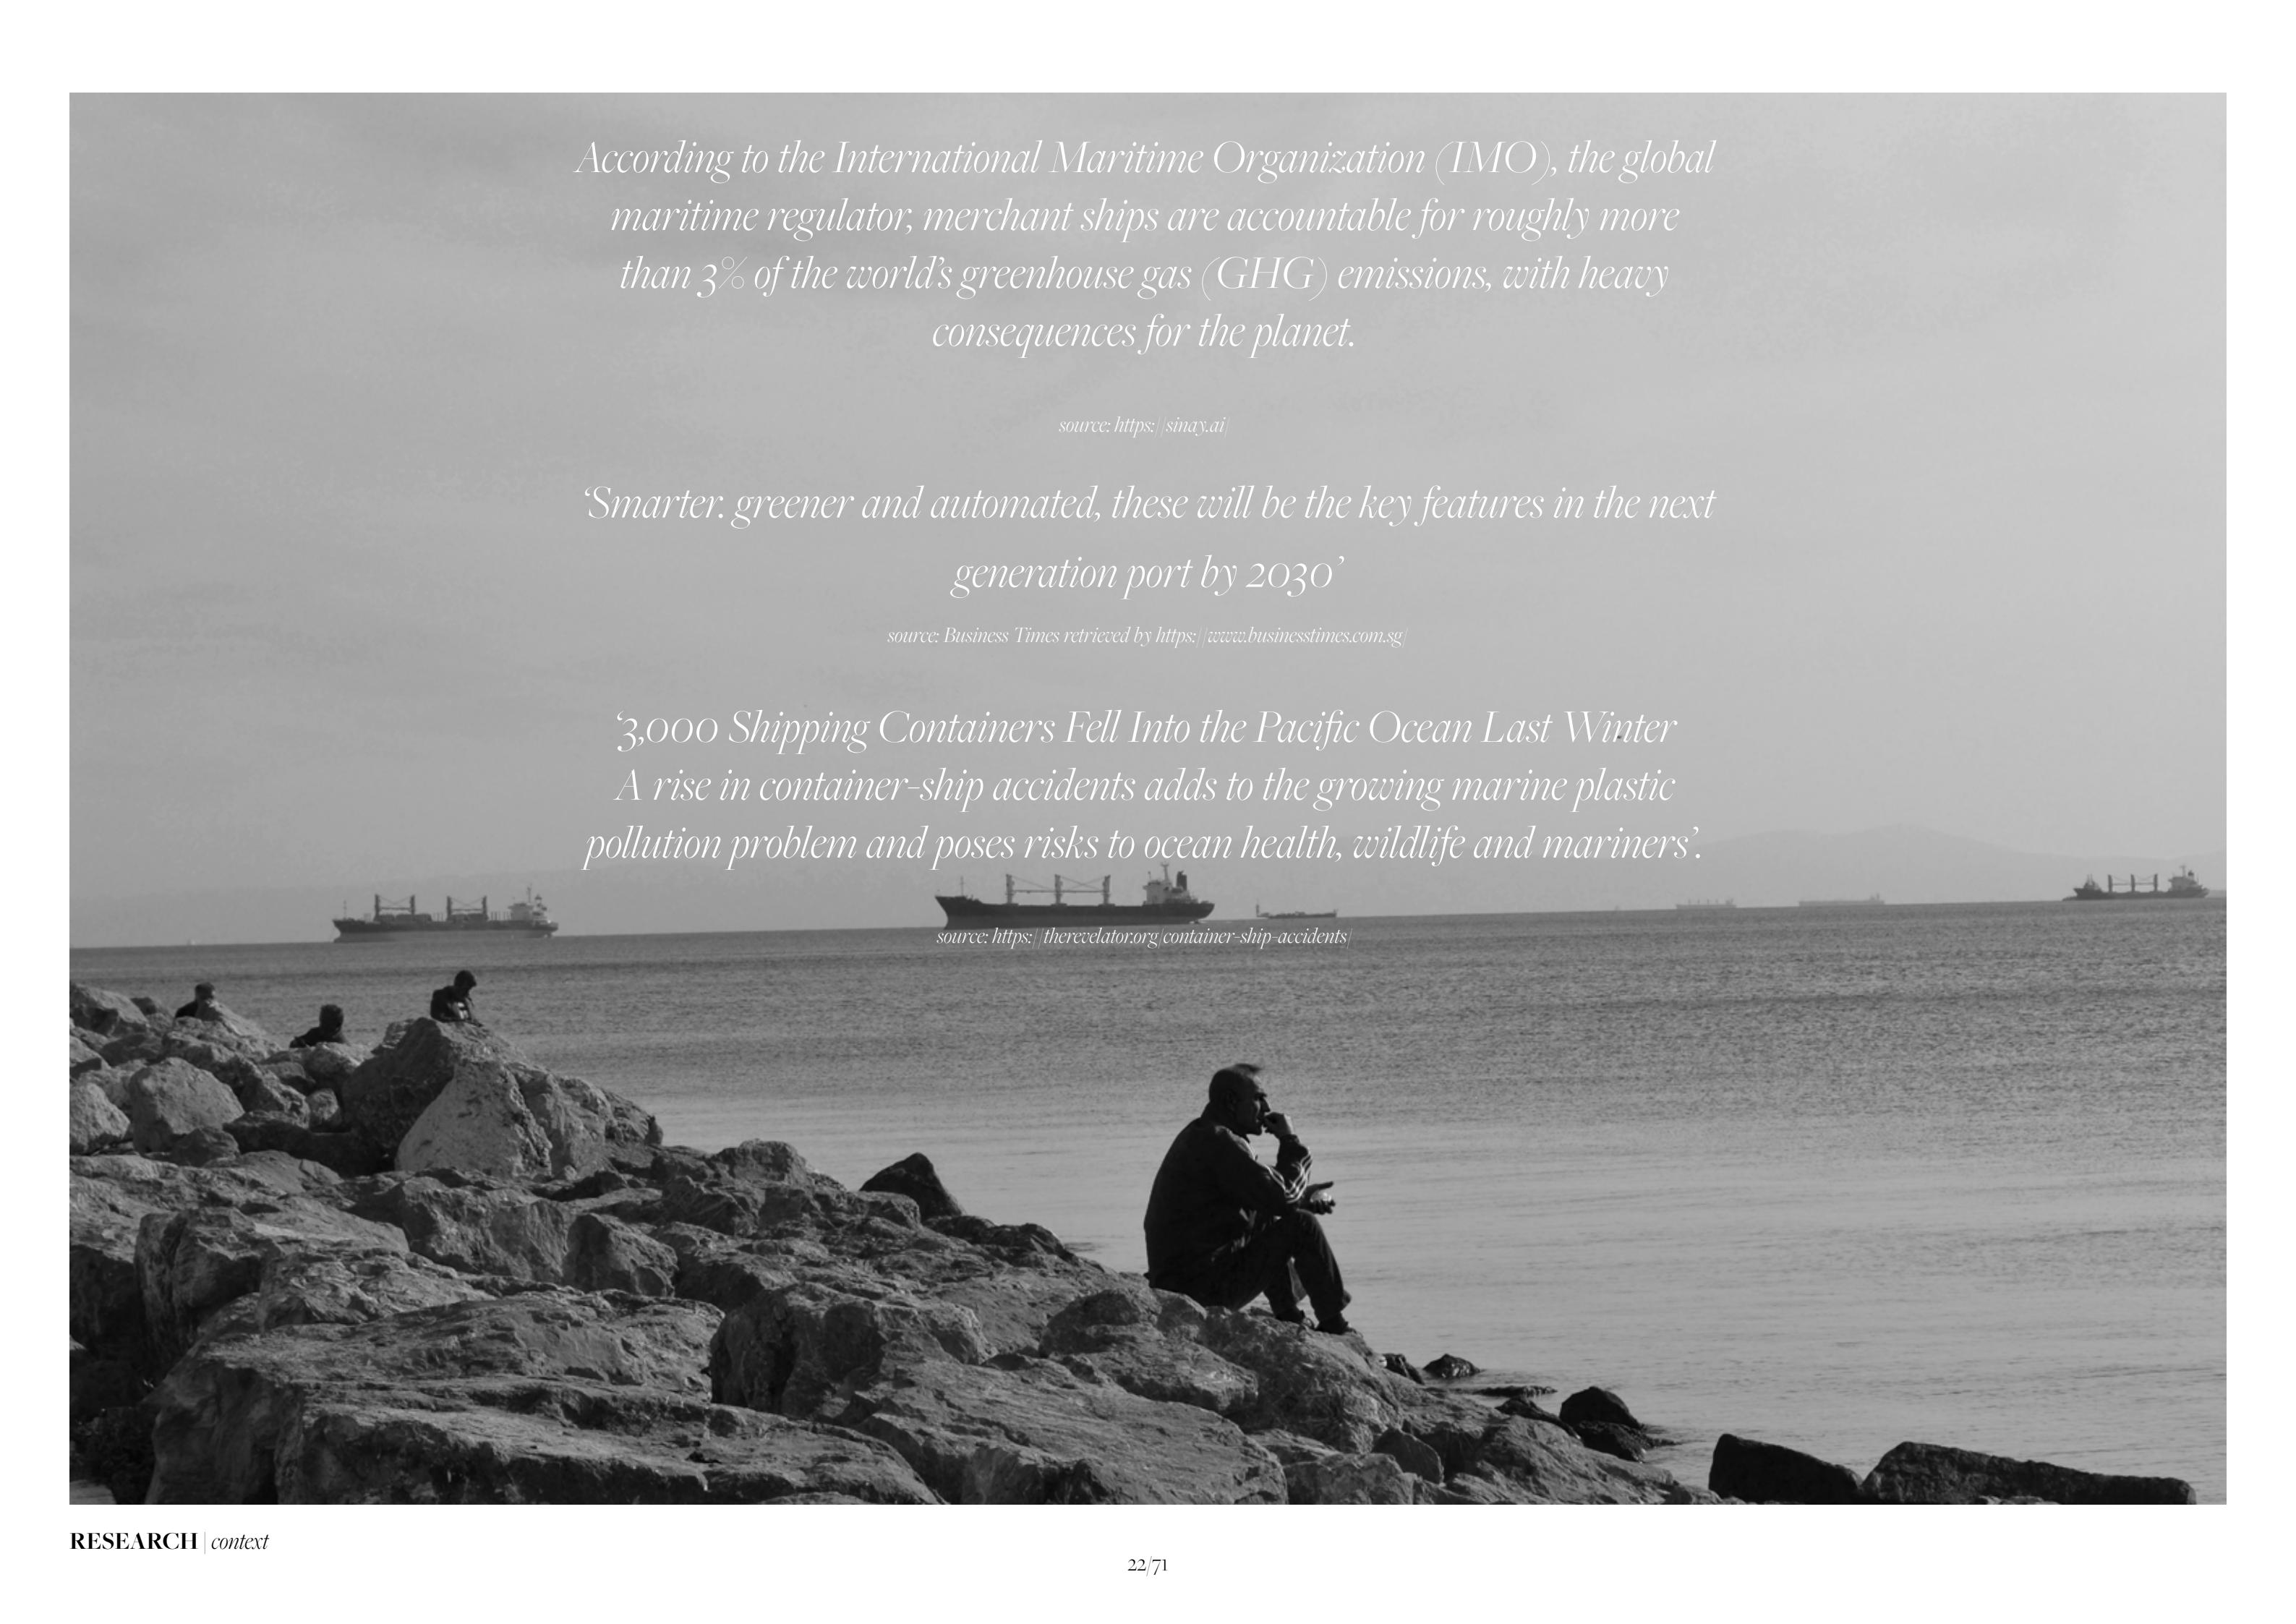

scale

efficiency and automatisaton

efficiency and automatisisation

According to the International Maritime Organization (IMO), the global maritime regulator, merchant ships are accountable for roughly more than 3% of the world's greenhouse gas (GHG) emissions, with heavy consequences for the planet.

Port Machinery	Motions	Tasks
 Container ship to shore STS cranes		Lifts containers on and off ships using a long horizontal arm called the boom. A specialised operator sits in a glass cabin which is connected under a device called a trolley. The crane driver can lower by wires the 'spreader' onto the top of a container which then locks onto the container using devices called twist locks. They are electrically driven and have a supporting framework that sits on wheels on rails so that they can move along the wharf to line up with the ship. A container ship may have up to 3 container cranes working on its simultaneous.
 Straddle Carrier		Unregistered vehicles to move containers within a container terminal. They move containers either to or away from the dock. The straddles are also used to load/unload trucks with containers. The straddles can be operated by a driver or they exist as automated, autonomous vehicles. The computers tell them which containers they need to pick up. They pick up containers by a 'spreader' which is placed on top of the container and locks onto it using specialised twist locks. Straddles stack an average of 5 containers high for storage in rows that allow the straddle to drive up and down over the stacks while carrying another container.
 Reach Stackers		Off road vehicles used to transport containers from one mode of transport to another. They are faster and more flexible than forklifts. They are operate by a driver who sits in a cabin at the front of the vehicle which has a long arm. There are also autonomous automated reach stackers. Reach stackers can pick up containers by using a device called a spreader at the end of its long arm. They can use their long and flexible arm to stack containers up to 4 rows deep.
 Empty container handler		Transport containers and stack them in rows up to 7 containers high. They handle empty containers. They exist as automated vehicles or operated by specialised drivers who sit in a cabin in the middle of the vehicle. The vertical arm can be about 20m high.
 Bulk grabs		Some cranes are used to unload load from ships of certain types of dry, loose, solid materials. They use a set of metal jaws called the bulk grab attached to the end of cables from the crane.
 double Traveling Girder overhead gantry crane		Commonly called a bridge crane, it consists of two parallel rails seated on longitudinal beams attached to opposite end walls by means of trolleys. The hoist is the lifting component of a crane, travels along the bridge. If the bridge is rigidly supported on two or more legs running on two fixed rails at ground level, the crane is called a gantry crane. Integrate well into different building structures, they offer maximum flexibility, available in numerous configurations. The travelling feature means mobility of the crane in the way it travels within a given area of operation. They can be electric or hydraulic drive. They can be remotely controlled.
 Rotary overhead crane		Rotary hoisted crane are the system that can be changed to overhead cranes as well as gantry cranes. It contains a 90° rotation movement, coupled to the trolley.
 mobile or fixed Rail mounted gantry crane, rotating. Single girder gantry cranes, double girder gantry crane &		Type of heavy crane, travelling on fixed track. Steel frame, hoisting mechanism, spreader anti-shaking mechanism, crane travel mechanism, trolley traves mechanism, container spreader. They exist in variations of non-rotating trolleys and are electrically powered. Semi-automated or automated deployment.
 Portal cranes - mobile slewing cranes		The vertical support members on a portal crane may be anchored to the ground, or mounted on wheels or tracks that allow the crane to move throughout the area. 'portal' being the empty space straddled by the gantry. are a type of crane used to straddle an object or workspace and the entire crane can be moved about a workspace. Slewing cranes: a slewing crane lifts its load, suspends that load in mid air, and then rotates it via a boom rotating mechanism. Non-slewing cranes, on the other hand, lack a rotating base section. A crane installation mounted on a portal with utmost mobility given through rubber tires. A portal crane on wheels.
 Portal cranes - Fixed cargo slewing cranes		Areas of application: container handling, stacking, bulk handling, scrap handling, heavy lift, general cargo. Fixed cargo cranes (FCC) are space-saving handling solutions for vessels up to post-Panamax class. The slewing cranes installed on fixed foundation pedestals comprise both cylinder lifting as well as wire lifting, slewing or double girder cranes. They provide the optimum balance between restricted space and cost effective turnover.
 Mobile slewing crane		Mobile cranes are designed to use a collection of simple machines in order to both raise and lower objects, as well as to move them horizontally. This type of crane can be easily moved from one location to the next.
 Portal cranes - Fixed cargo slewing cranes		Horizontal displacement of the trolley and movement by raising the jib. Top-Slewing cranes are the large construction sites most strategic equipment for productivity. Whether on large infrastructure, high rise jobsites, crowded urban areas or wide open sites, they make it possible to hoist and distribute load high and far.
