LOAD BEARING STRUCTURE & STABILITY 1:200

Floorplan

The columns are placed in a set grid of 1,8 and 3,6m. Only the far right part of the building is an exception.

The stability is taken care of with the use of wooden frameworks. These are placed in between the columns, and the finishing of the facade or inner wall is attached to this framework.

CONCEPT COMMUNITY CENTRE

Transferable concept

Settlements know the same type of problems, which can partly be tackled by the functions of the community centre. The community centre concept can therefore be applied to more areas in the settlement Zandspruit, or even be applied to other settlements.

CONCEPT DESIGN

PROGRAM OF REQUIREMENTS

	Minimum of 24 students	30 M ²		Working 3 desks at the same time	10 M ²
	10 private rooms	110 M ²		Multifunctional room for a minimum of 30/40 people	45 M ²
	Cooking for minimum 24 students Helping +- 30 families with food bags	30 M ²		Total of 4 toilets	6 M ²

PASSIVE VENTILATION

Floorplan 1:200

Section 1:100

Netting above door

Window sliding panel

Passive ventilation is used because of the context. There is no money available to regulate the ventilation with mechanical systems. The hallway with openings on both end will create a good circulation. Each room will have windows that can be opened to let fresh air enter. The used air can be transported outside via the hallway or the lattice girders. These will have sliding panels which can be opened according to the need of ventilation. Doors will have netting above them to stimulate the circulation of used air towards the hallway.

WATER SYSTEM

Concept

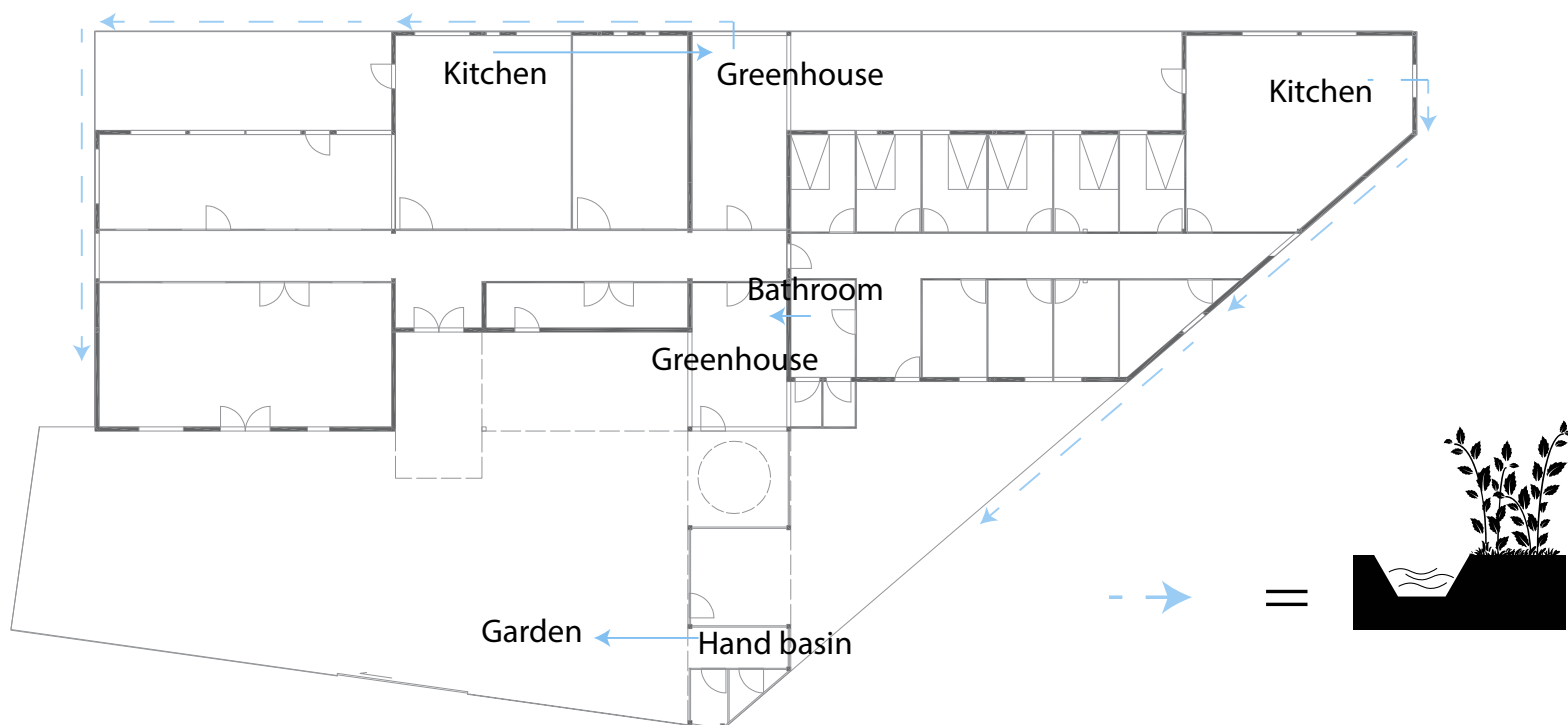

Floorplan first step

Function	Total of water per day
Shelter	390 L
Greenhouse	60 L
Kitchen	80 L
Study area	10 L
Multifunctional	10 L
Toilet	70 L
Total	620 L

If some water is used a second time, around 550 L will be used per day. Almost 4000 L used in a week.

Place a 5000 L water tank size: h= 2,25m d=1,82m

Floorplan second step

The watersystem of the plot will run first on rainwater that is being collected in a water tank. Rain comes very irregular, and to run the building only on rainwater, a very big tank is needed, for which the plot is too small. Therefore I chose to create a buffer of around a week. When there is not enough rainwater, the tank can be filled with water coming from the municipal pipeline. Certain functions require water, which can be called the first step of the water system. The water that is being used here, can be used for a second time, in the garden or greenhouse. If it will not be used, the water will find its way to the ditch around the plot. The water will feed the plants that create the wall.

The South African summers are hot, but during winter it can get quite cold. To make optimal use of the warmth of the sun, the rooms are organized based on the path of the sun. Therefore the time of usage of the rooms are placed next to the data of the sunpath. With the result that the shelter receives sunlight during the early morning, and the public functions like the kitchen and office the entire morning and early afternoon.

Most rooms have natural (sun)light entering during the wintertime to heat up the space, but the light will be blocked during the summer to keep out most of the heat. The shape of the roof will help with this.

FACADE CONCEPT

CIRCULARITY OF MATERIALS

Already available materials

Second hand building materials + waste materials

Only 16 % of construction & demolition waste recycled

Table 5: Tonnesages of general waste imported and exported in 2017 (in tonnes)

Total general waste (t)		20 287 837	137 400	20 425 237

Variety of options for wall design

The inhabitants of Zandspruit already build following the concept of circularity, although this is mostly because of their economic situation. For this design the same path is followed. There are already second hand building materials available as seen in the photos. The rest of the building materials will either come from demolition sites or collected as waste. Now only 16% of construction and demolition waste is being recycled, so there is a big market for circularity. Furthermore paper and plastic are big waste groups, so ideal for building. Because of all these options, there is a wide variety of wall finishing possible. The design depends on what materials are available.

CHOICE OF MATERIALS

Choice of material matched with functions
