INTRO DUCTION

This design report illustrates how the research strategies, as formulated in the research report by the author 'Towards Productive Neighborhoods' (J. Vermeulen, 2024), can be applied to case studies on various scale levels. These range from the national scale, to the urban planning scale, the architectural scale, the level of the dwelling and even down to the details and materials. Potential solutions are investigated by research through design in addition to the theoretical research in the research report. The design research is based around the research question:

“Can industrial urban areas be redeveloped in response to the agricultural transition and mitigate the housing crisis with inclusive, affordable housing communities?”

The design research is subdivided into several chapters that aim to introduce the problem statements, the research scope and answer the subquestions:

“Why do we face a housing crisis & what does an agricultural transition entail?”

“How can industrial urban areas be redeveloped into mixed-use neighborhoods?”

“Can industrial buildings be transformed into mixed-use housing communities?”

“How to realize affordable housing types without losing essential qualities?”

This aims to find answers to these question through research by design. It starts by exploring an industrial urban area in Rotterdam; the Spaanse Polder. Through the gathering of data and information, a better profile is illustrated of the area, and the future plans. A strategy is formulated that aims to re-arrange the urban fabric while respecting the existing functions. A more efficient use of space could allow for a mix of various functions which can co-exist in harmony. The second part of the research zoom in to the architectural scale, investigating how an existing building could be transformed into a mixed-use building. Topics such as massing studies, circulation principles, structural integrity, and the programmatic mix are discussed. After establishing a general architectural approach, part three of the research takes off; designing dwellings. Not just ordinary homes, but living clusters. Larger units that house a variety of dwelling types for a broad range of tenants. Collective use and social interaction is an important starting point for the arrangement of space. Every floor plan has dedicated 'shared spaces' for social gathering and leisure. From shared courtyards, to shared kitchens for optimal interaction and community building. The last part of the research delves into the building technology; how can such an idea be realized and constructed? The last chapter discusses themes as sustainability and circularity principles. Structural integrity, installation technique and climate design, and facade engineering and detailing with local bio-based materials.

**RE-DEVELOPMENT CASE STUDY:
INDUSTRIAL URBAN AREA
THE SPAANSE POLDER**

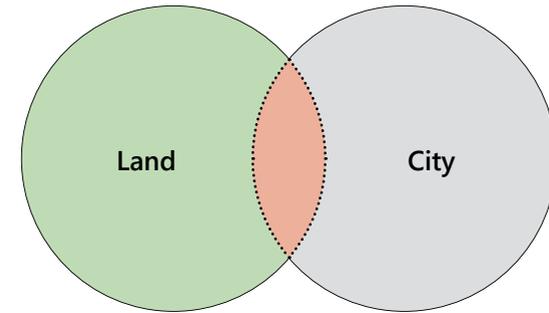

Regional Map. The surroundings and situation of Midden-Delfland, enclosed by large cities and industry (GE, 2024).

THE INTERSECTION OF LAND AND CITY

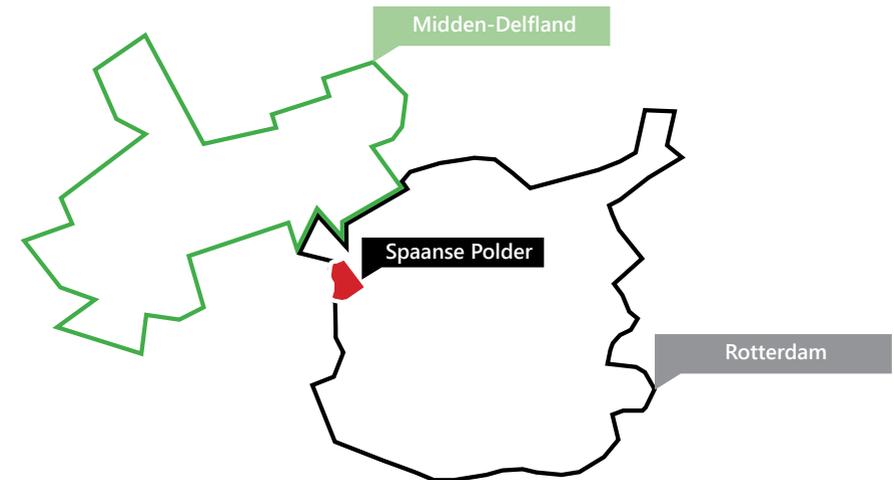

Midden-Delfland is a large agrarian landscape situated between the cities Rotterdam, Delft, The Hague and Westland. All the surrounding urban regions exert pressure on the residue landscape of Midden-Delfland; cities want to expand their suburbs into the polders, and Westland (the large horticulture region) wants to expand its greenhouses into the landscape as they cover much ground, which is running out in Westland. Although the current landscape is considered to be unsustainable (both financially and ecologically) by experts, plans have been made to redevelop this area into a national production park. It can become an area with significant biodiversity, the potential to store and filter large amounts of water, and to store enormous amounts of CO₂ (which would otherwise be emitted due to the subsidence of the peat landscape). A transition towards a sustainable production landscape would also indicate that a lot of functions, people and activities that would usually take place on the landscape will migrate elsewhere as they make place for new activities.

On the other hand, the surrounding urban areas are faced with a continuously growing demand for housing and lack of space to construct these new dwellings. While expansion of the urban fabric into the landscape can result in new space for housing, it is not a very sustainable planning method as it requires a lot of additional energy, resources (infrastructure, facilities, utilities, and public space). These would need to be created from scratch, while there is a lot of space already available in cities, but this space simply needs to be discovered or re-arranged. One of the areas in the Netherlands that hold potential to be redeveloped are industrial urban areas. Although these areas are also needed for other activities and facilities, there is a lot of square meters available for rearrangement. Especially industrial areas in close proximity to city centers hold potential, as these often are large in area square meters, infrastructure is already in place, and facilities are nearby. The Spaanse Polder, an industrial urban area in Rotterdam is situated at the intersection of both the large landscape of Midden-Delfland and Rotterdam, potentially providing solutions for various transitions. The design research analyzes the Spaanse Polder, the future plans of the district, and how it could play a role for the many spatial transitions we face. A strategy for the redevelopment of the area will be formulated and architectural interventions are further elaborated on during this research.

Spaanse Polder

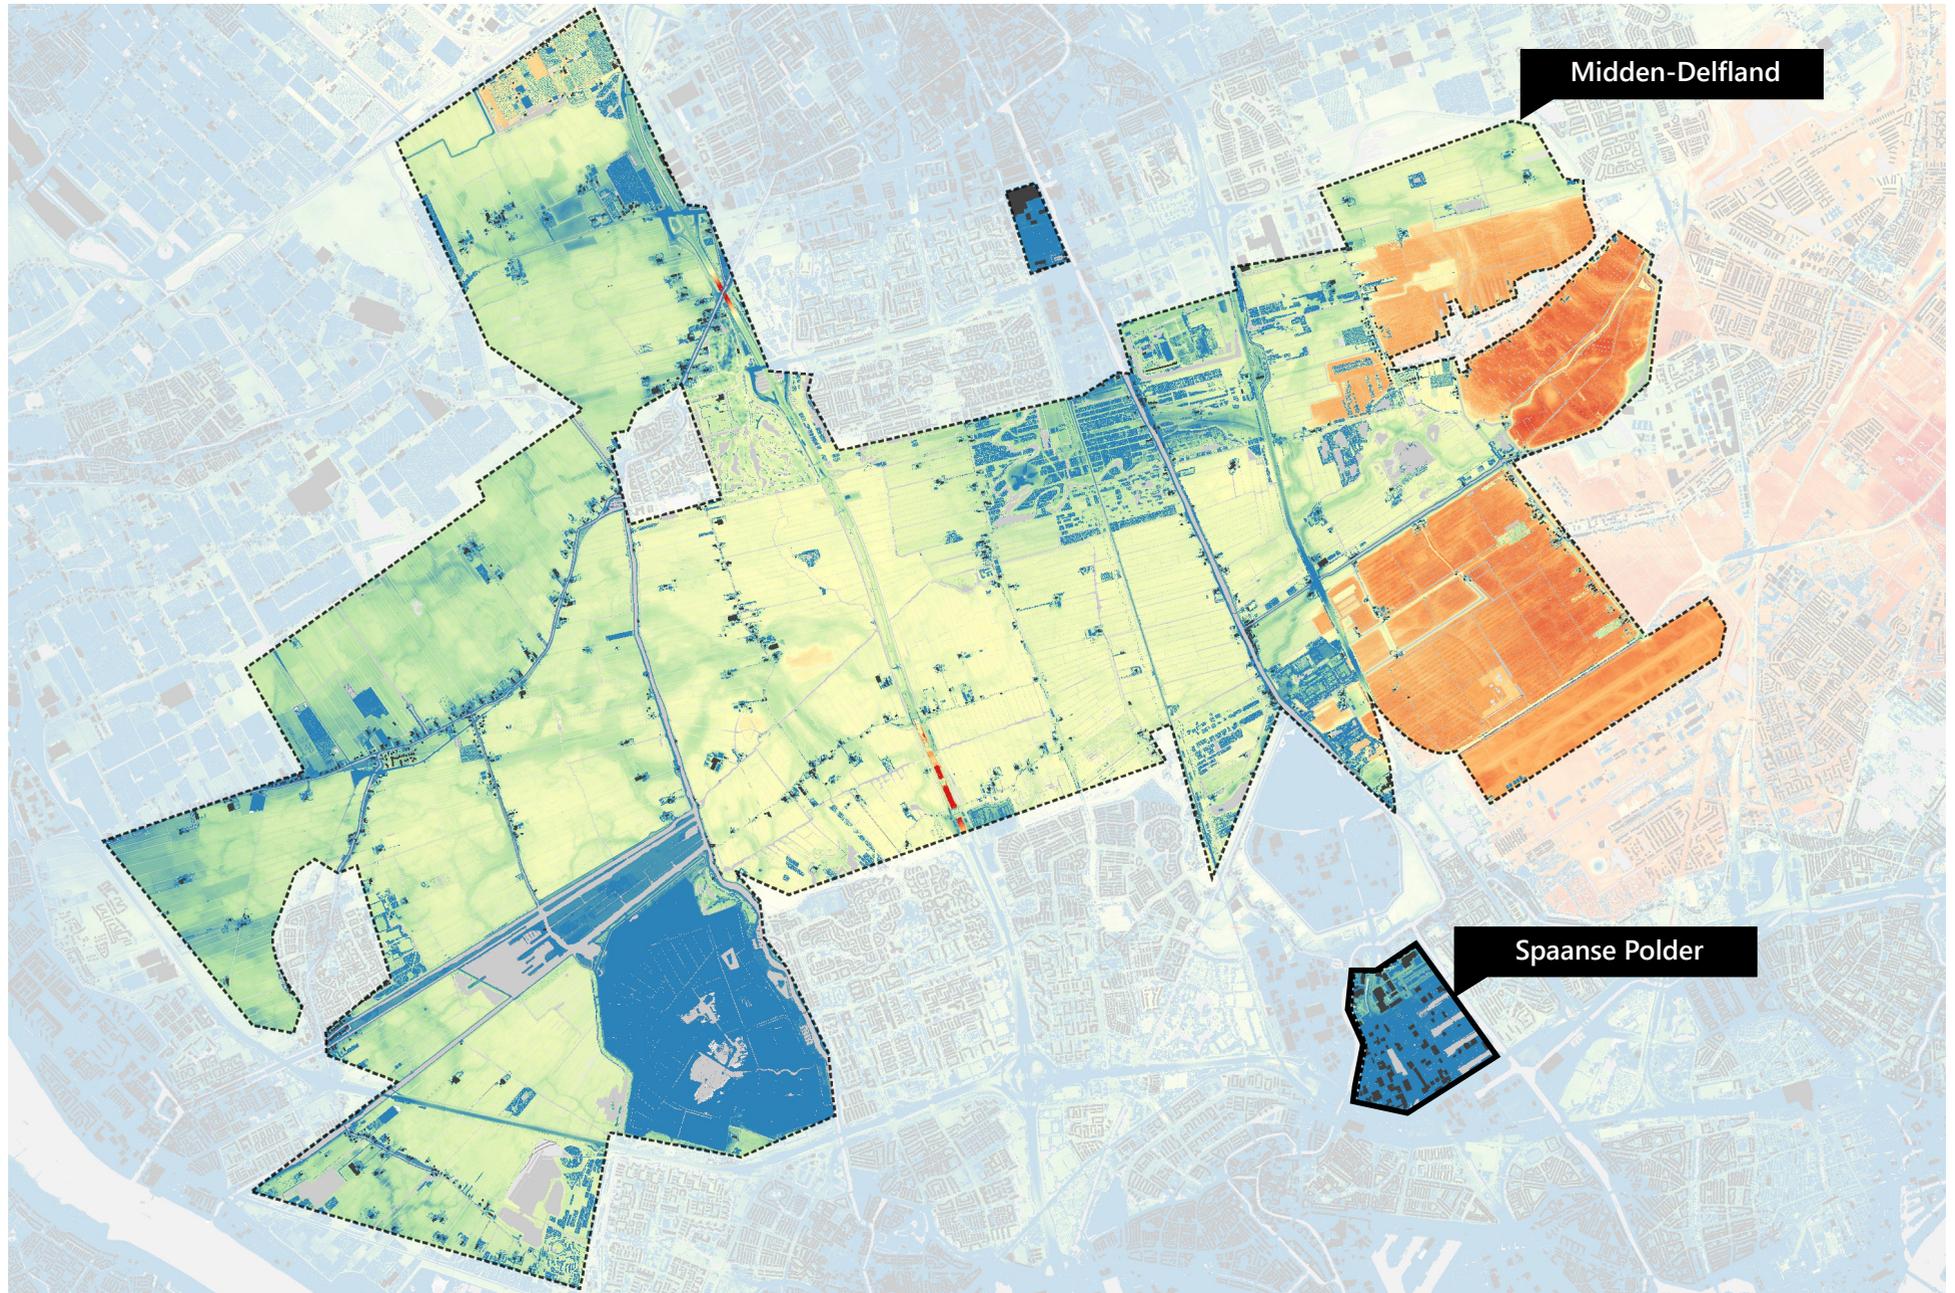

The industrial urban area is situated at the intersection of both land and city

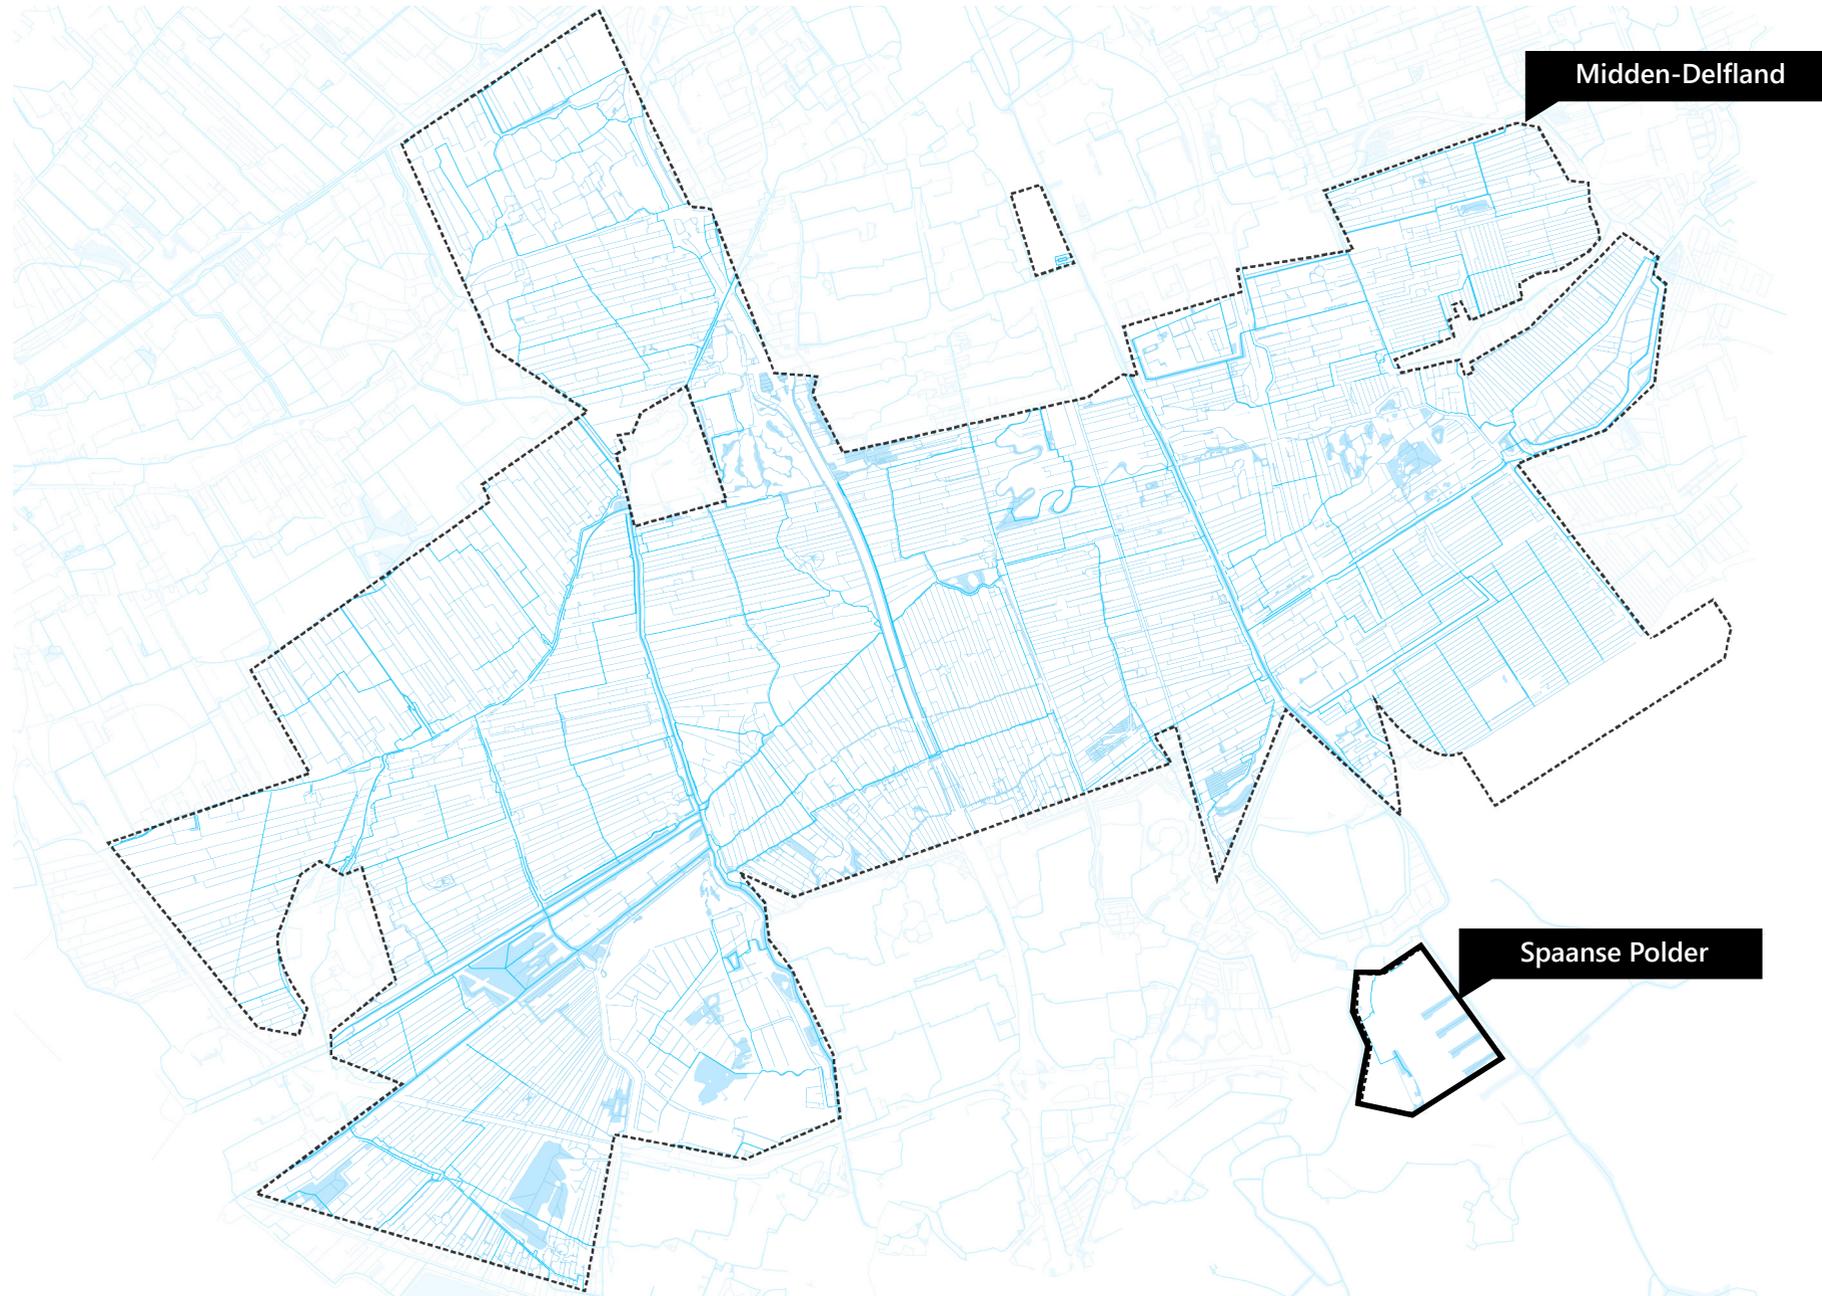

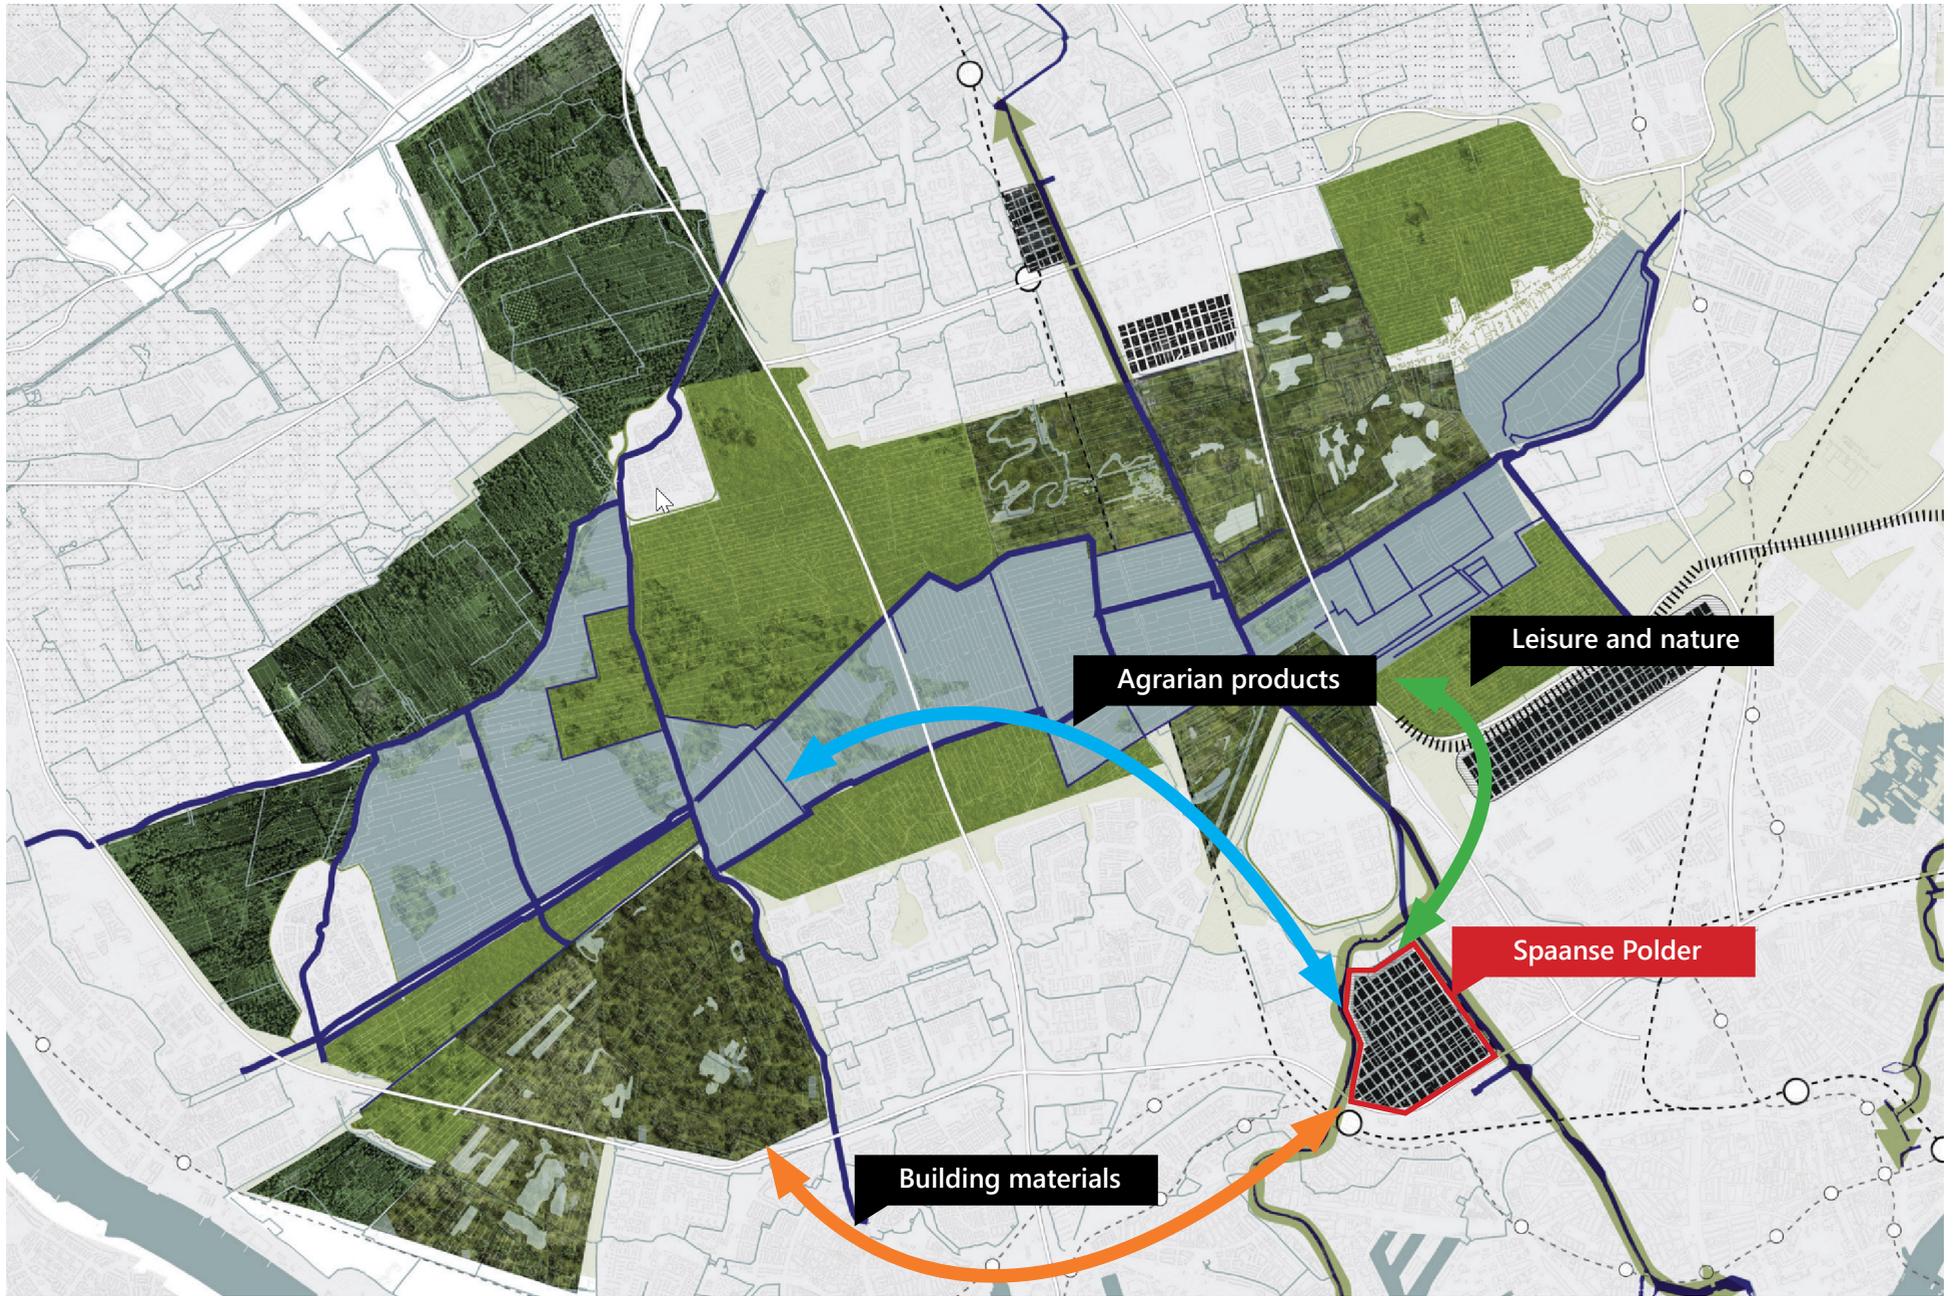

Midden-Delfland. *The landscape of Midden-Delfland is characterized by an intricate tapestry of ditches and waterways (BGT, 2021).*

Midden-Delfland. Due to the subsidence of the peat landscape, the majority of Midden-Delfland is situated below sea level (AHN, 2021).

Midden-Delfland. A complex, expensive and unsustainable water management system is required to irrigate the landscape (BGT, 2021).

LOCAL MATERIALS

Light structural beams/columns		<ol style="list-style-type: none"> 1. Spruce or poplar wooden beams (Gadero) 2. Galvanized steel connection points/insert leafs (when needed) 3. Wooden connections with minimal use and visibility of steel
Heavy beams & floorsystems		<ol style="list-style-type: none"> 1. Glue Laminated beams (Stora Enso - various sizes) 2. Cross Laminated timber (Stora Enso - 150mm 5 layers) 3. Galvanized steel connection points/insert leafs
Facade exterior materials		<ol style="list-style-type: none"> 1. Larch wood for exterior use: Spacers, windowframes, plating 2. Larch shingles with cavity behind it for passive cooling 3. Galvanized metal (exposed) rainpipe, zinc windowsill
Insulation material products		<ol style="list-style-type: none"> 1. Woodfibre insulation boards (Pavatherm - pressure resistant) 2. Flax insulation material in the walls (Isovlas) 3. Hemp insulation material (Isohemp) - optional
Interior finishes products		<ol style="list-style-type: none"> 1. Multiplex materials as a wall finish or 2. Pine wood for wall/floor/ceiling finish

Material ambitions: Re-use existing (building) & use local bio-based resources *

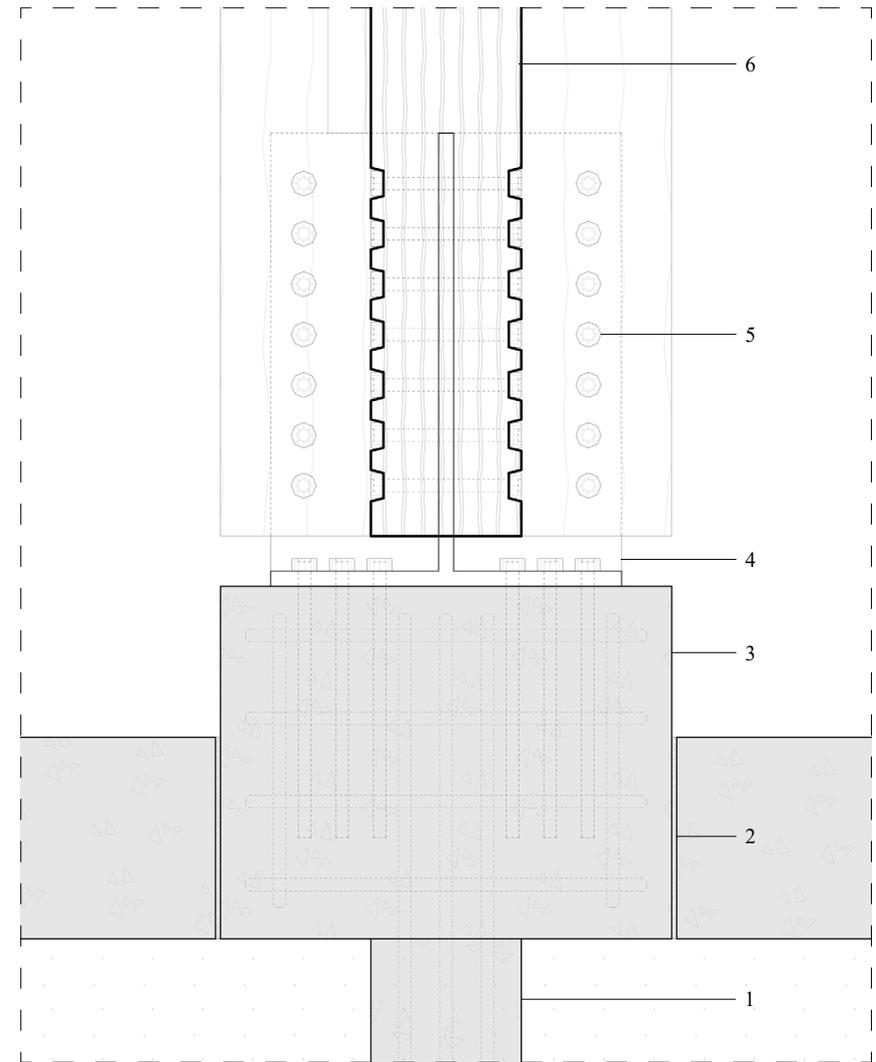

- Light structural beams/columns:** Pine or poplar trees that can grow locally.
- Heavy beams & floors:** CLT & Glulam from locally sourced pine/spruce trees.
- Facade:** Durable larch spacers, frames and shingles, locally grown/sourced.
- Insulation:** Flax insulation, woodfibre insulation, hemp & cattail (optional).
- Interior:** Multiplex (made from pine/spruce/fir) or pine wood finishes.

DETAILING FOR SUSTAINABILITY AND DEMOUNTABILITY

The details are engineered to allow for demountability so that the materials can be re-used in a circular way during their life cycle. The selection of materials to build with are local materials that could be grown and harvest close by to reduce transportation cost and emissions. For the exterior, a more durable wood is used; larch wood, which can withstand the elements better. For the inside, mainly birch wood is considered as it grows fast and locally. The structure can also be made with a birch or pine wood because it will be enveloped completely by the insulation layers and skin of the building. This will guarantee the longevity of the structure. Towards the south side, the facade is extra thick because an open cavity is present between the skin (larch shingles) and the insulation layer of the facade. This will provide the building with passive cooling/ventilation and prevents the south facade from overheating during the summer. Due to this thickness, the window openings are also very deep and can block a lot of summer sun but allows for the winter sun to enter the building. Hidden sun blinds are installed externally for sun shading. The roof is covered with crystalline solar panels that can be integrated architecturally. The roof scape of the building will be able to generate energy, while aesthetically being part of the architecture. The dwellings are situated around small green courtyards for visual comfort and social interactions. The courtyards also play their part in the management of water, which can be collected and re-used in the building.

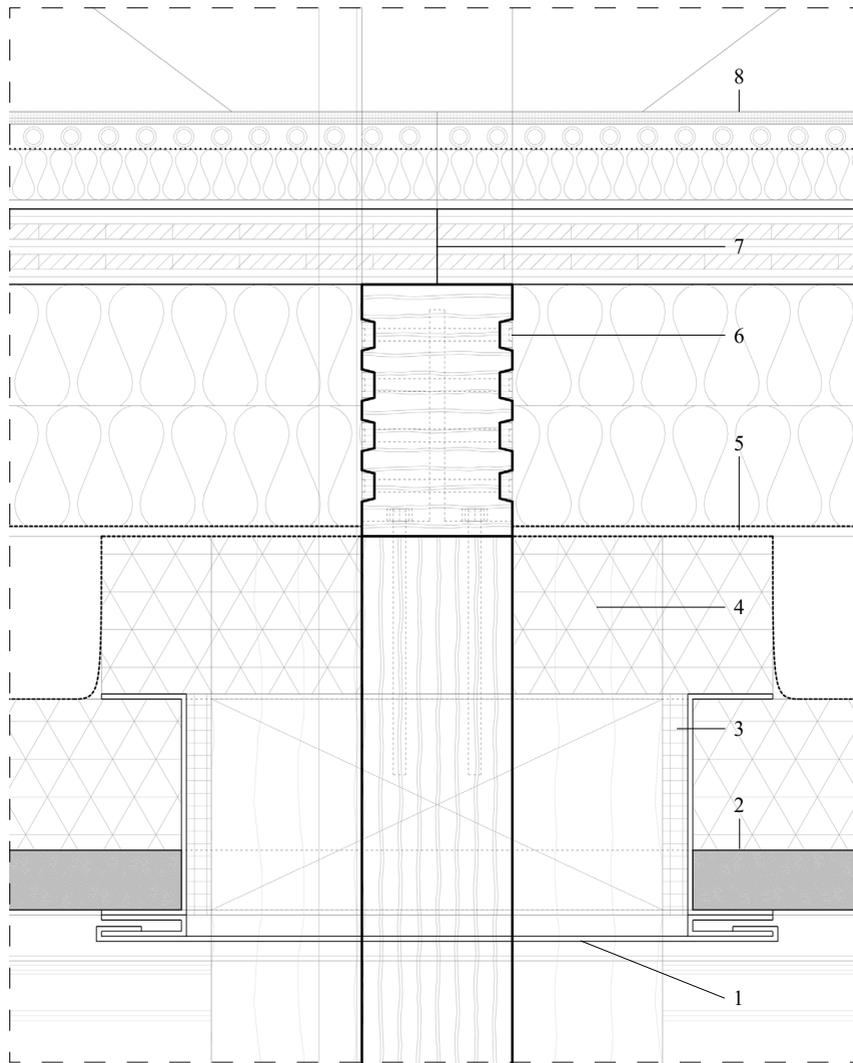

DETAIL FOUNDATION

Detail Foundation - Scale 1:10

1. Vroom prefab reinforced concrete foundation 26 meters, 290x290mm, C55 XC2.
2. Existing concrete floors 400mm, Peridam Tempex incision separation strip 5mm.
3. In situ concrete connection with foundation head, interwoven reinforced steel connection.
4. Adjustable galvanized stainless steel column base with insert leaf 700x900mm.
5. Galvanized steel class 4.8 Bolts 300mm, same bolts at the concrete base 500mm.
6. Glue laminated timber column, 900x900mm, 300mm in width, 10 meters in height.

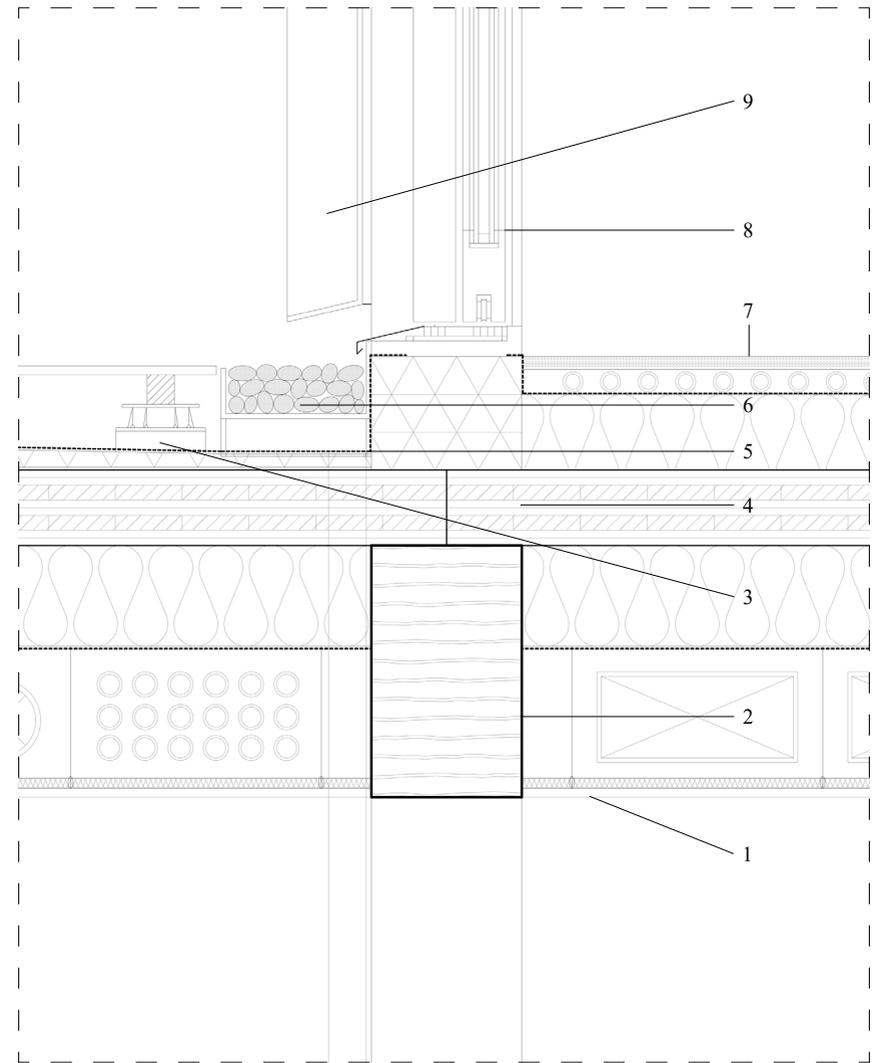

DETAIL COLUMN

Detail Column - Scale 1:10

1. Folded steel 2mm, attached to perforated concrete roof, central cut out for column intersection.
2. Existing concrete roof, waffle panels 150mm, situated on existing galvanized steel beams IPE 180.
3. Tempex EPS incision separation strip 50mm, for column positioning and concealment of the side cavities.
4. Pavatherm pressure-resistant insulation 300mm (Rd – 7,86 m²K/W), water resistant foil, bitumen roof covering
5. WBP wooden plate 18mm, Isovlas, water resistant foil, flax insulation 500mm (Rd – 13,12 m²K/W).
6. Adjustable galvanized stainless steel column base with insert leaf 300x450mm, galvanized steel class 4.8 Bolts 300mm.
7. Stora Enso CLT flooring system (5 layers) 150mm, width 2,75m and length 10m, non-visual quality (NVI), fire protection board 18mm
8. Flooring finish, floor heating in 100mm concrete screed, PE damp proof membrane, Thermoflex wood fiber insulation 100mm

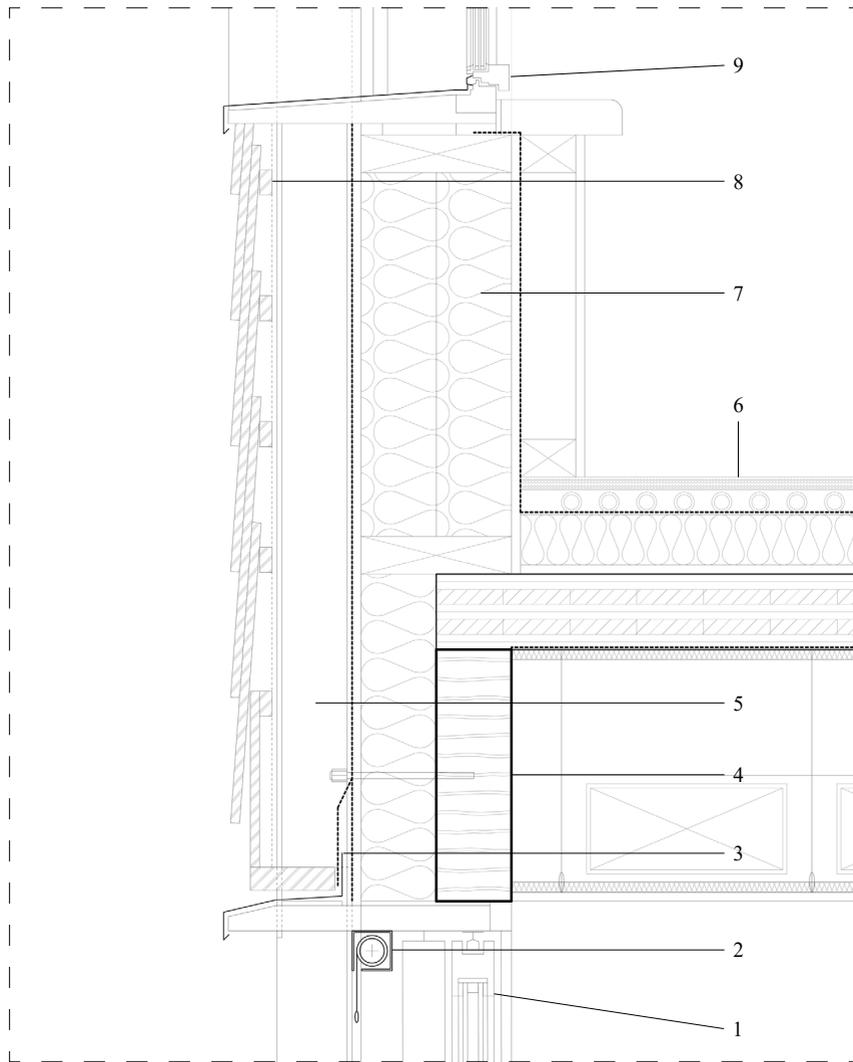

DETAIL FLOOR

Detail Floor - Scale 1:10

1. Climate ceiling 300mm, perforated fir 18mm, 50mm felt acoustic layer
2. Glue laminated beam 500mm, width 300mm
3. Dural patio support system, larch beam 50mm, larch terrace planks 18mm
4. Stora Enso CLT flooring system (5 layers) 150mm, width 2,75m and length 10m, non-visual quality (NVI)
5. Pavatherm pressure-resistant insulation 300mm (Rd – 7,86 m²K/W), water resistant foil, bitumen roof covering
6. Drain stone linear element for gravel finishing; stainless steel drainage system with pebbles for water filtration
7. Flooring finish, floor heating in 100mm concrete screed, PE damp proof membrane, Thermoflex wood fiber insulation 100mm
8. Sliding door: insulation glazing in larch frame: 2× 4 mm lam. safety glass + 16 mm cavity + 2× 4 mm lam. safety glass, U_g = 1.0 W/m²K
9. Exposed galvanized steel rain pipe, depth 150mm and width 300mm, attached to structural column

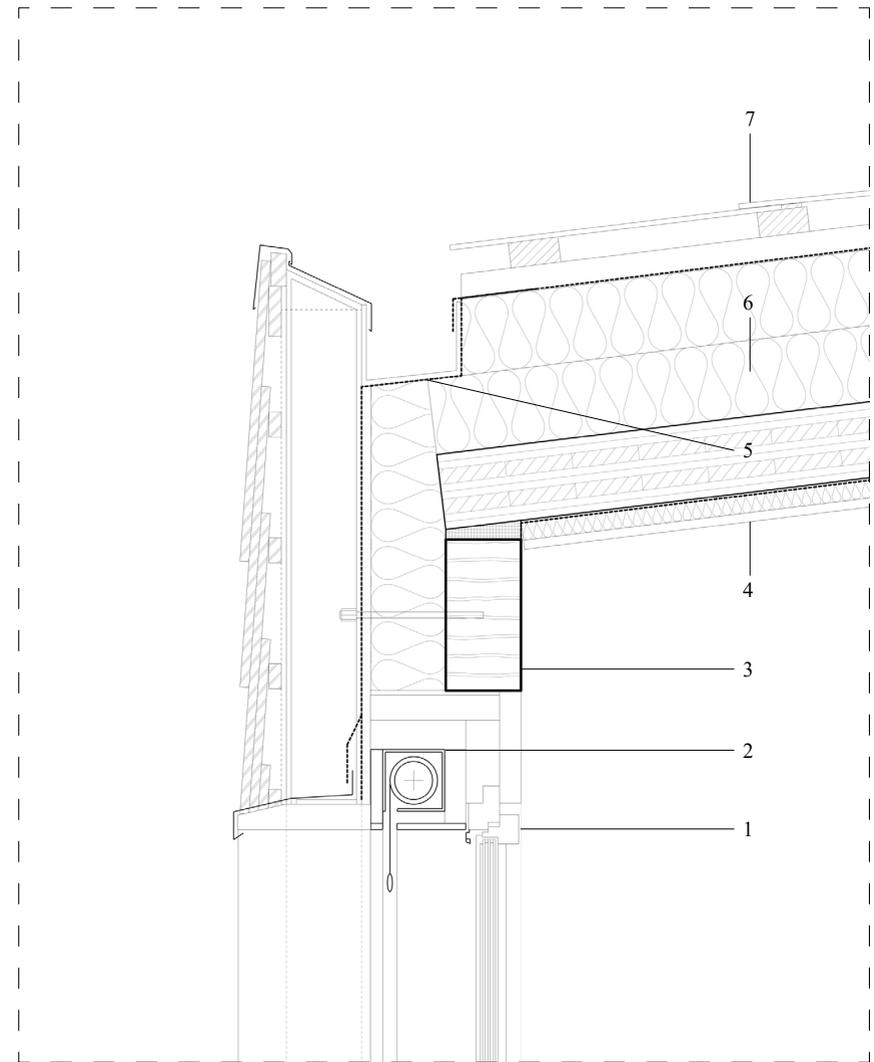

DETAIL WINDOWS

Detail Windows - Scale 1:10

1. Sliding door:insulation glazing in larch frame: 2×4 mm lam. safety glass + 16 mm cavity + 2×4 mm lam. safety glass, $U_g = 1.0$ W/m²K
2. Ritscreen, electric retractable exterior window screening to mitigate solar gain in summer
3. Sheet zinc cornice, pre-weathered for water drainage, water resistant PE membrane covering
4. Glue laminated beam, height 500mm and width 150mm, rainpipe locally bolted to structure
5. Facade cavity for passive airflow and cooling, hidden galvanized steel rain pipe, depth 150mm and width 300mm, attached to structural beam
6. Flooring finish, floor heating in 100mm concrete screed, PE damp proof membrane, Thermoflex wood fiber insulation 100mm
7. Water resistant PE membrane, WBP wooden plate 18mm, Isovlas natural biobased flax insulation 300mm ($R_d = 7,86$ m²K/W), multiplex 18mm
8. Larch shingles split 2-layer length 600 mm, Support battens 25 mm, vertical spacer battens 160 mm, PE membrane, WBP wooden plate 18mm
9. Insulation glazing in larch frame: 2×4 mm laminated safety glass + 16 mm cavity + 2×4 mm laminated safety glass, $U_g = 1.0$ W/m²K

DETAIL ROOF

Detail Roof - Scale 1:10

1. Insulation glazing in larch frame: 2×4 mm laminated safety glass + 16 mm cavity + 2×4 mm laminated safety glass, $U_g = 1.0$ W/m²K
2. Ritscreen, electric retractable exterior window screening to mitigate solar gain in summer
3. Glue laminated beam, height 500mm and width 150mm, rainpipe locally bolted to structure, CLT roof panel bolted to beam
4. Ceiling panels perforated fir 18mm, 50mm felt acoustic layer, PE damp proof membrane.
5. Water resistant PE membrane, galvanized steel, hidden gutter 300mm connected to vertical rainpipe
6. Stora Enso CLT 150mm, Pavatherm pressure-resistant insulation 300mm ($R_d = 7,86$ m²K/W)
7. Glass monocrystalline 7.5 mm, battens 50 mm, counter battens 50 mm, bitumen roof finish, water resistant PE membrane

SYNTHESIS

While theoretical research allows for the formulation of problem statements, the research by design engages the author to re-think the status quo. Instead of describing precedents, design research commands visionary thinking. The built environment is a very slow field, very much depended on outdated production technology and commercial business models. Envisioning alternative ways of developing, building and living requires some courage. The case study as a whole is therefore not a very conventional project, it rather questions the status quo of developing and living. Although it might not be the solution, it perhaps can be one of the solutions that can alleviate some of the tensions on the housing market. With the agrarian transition and the housing crisis, a lot of space is needed to accommodate this. The research has shown that industrial urban areas, nearby city centers, are indeed interesting and potent places to pay attention to. In a time where space is a scarce commodity, we need to re-evaluate how we use the space we have available. The research shows that, by re-organizing space, a lot of room can be allocated to other functions such as living and leisure. By redeveloping urban areas, the public space can also be upgraded with more greenery, activities and facilities. The transformation of an existing building has proven to be a complex challenge. Although building something from scratch might be easier, it is definitely important to understand how we can re-purpose and re-use our existing building stock. The existing building will outnumber the newly constructed buildings for a very long time. This means that there is a lot of space available, but we need to re-imagine how we can live. The broad range of floor plans for the dwellings are a good example of re-imagining the way we live. Due to the collective nature of the clusters, the floor plans are far from conventional and have resulted in interesting configurations that can add a degree of complexity and charm to the dwellings. The challenging part is the engineering of the building, therefore this chapter contains a broad range of products that explain how such a transformation could take place. The structure is elaborated on, the climate design, and the facade engineering. The mix of functions could allow for a symbiosis between functions. The production hall and dwellings could interchange energy and resources which would otherwise be lost. There can be an interesting contrast between the old (steel, concrete hall) and the new (light, wooden, bio-based dwellings). Building with bio based materials such as wood allow for more circular (dismountable) and sustainable (low carbon emissions) building methods. Building with these materials also allows for a sense of aesthetics as the palette and textures of the materials are more present.

Keywords: housing crisis, agricultural transition, industrial urban areas, transformation, local ecologies, inclusive neighborhoods, affordable housing.
