## Mixed reality: the next step in critical emergency calls?

Straightforward three-dimensional instructions in mixed reality so anyone can apply professional first aid without any prior training.

The mixed reality experience highlights all the crucial tools and emergency exits that can help save lives.

Clear communication during the emergency call with a visual feedback layer, so there are no doubts while handling an emergency.

Unfortunately, accidents and emergencies happen every day. Today, emergency services only rely on auditory information from the caller; to dispatch the right tools and instruct the caller.

Imagine if the dispatcher gets extra visual information and sensors to their disposal. Or that the caller receives immersive, self-evident instructions right in front of their eyes. So they can provide aid without taking their hands or their attention away from the emergency.

That is all possible with EVU. EVU, Emergency Vision Unit is a mixed reality helmet to professionally deal with critical emergency calls while the first responders are on their way.

EVU provides visualisation of instructions in real-time to the caller during an emergency and gives the dispatcher real-time visual information to assist.
