

Improved Sanitation for Refugee Camps

In low-resource settings such as refugee camps, **inadequate sanitation and poor hygiene contribute to the spread of infectious diseases**. Adequate access to safe drinking water, sanitation and hygiene (WASH) could have prevented at least 1.4 million deaths in 2019.

Without improved sanitation, hygiene education, and clean water access, these preventable diseases will continue to threaten public health in these areas.

Scheduled Emptying

The SaniSecure Toilet was developed to directly address these issues. It features a sealed sludge container that prevents groundwater contamination, a robust and flood-resistant structure, and an inclusive design that accommodates users with mobility challenges.

Hygienic & Efficient Transport

WASH Education

The SaniSecure Service complements the toilet by providing scheduled emptying & maintenance. Beyond emptying, the Service Group plays a key role in educating users about WASH practices and providing access to cleaning supplies.
