## Enriching the field of explainable AI experiencing the physical side of AI to gain an understanding of the ecosystem behind your screen

This installation offers users an interaction with the water infrastructure needed to run the generative AI tools we use. Water is used to cool data centres, to cool energy generation plants, in refining processes and in manufacturing processes. These streams come together at an Chat GPT interface, which will offer some valuable insight into the system.

The water used is often drinking water, which is polluted with additives to make it usable in the system. After use, the water is discarded into natural ecosystems. In this installation an alternative is offered. If you wish not to waste drinking water, you can tap it for your own use, your choice...
