The building for the United Nations Environmental Council has an extraordinary interior that derives from the four themed towers (wind, water, rejection and solar chimneys), which all have a determining effect on the cultivation, thermal solar panels, hydro storage, PV cells, river heat resources (passively and actively), using wind turbines, algae, solar, etc. The building employs environmental directions in winter and summer, daylighting conditions and natural ventilation. Furthermore, the building radiates to the world the importance of sustainability.

Spaces for short stay are created to stimulate encounters and lobby. This will always be part of the hall full of activities. The natural obstacle of height from the openness of the hall to a more secluded space, while still facilitating lobby, stimulate people to participate and above all radiate to the world the importance of sustainability. The building for the United Nations Environmental Council has an exemplary role, has to be recognizable, easily accessible, relevant as well that it increases the observers awareness and will lead to a gradual change of attitude with regard sustainability.
