Shopping Centre at Rokin, Amsterdam

Specialist Mall

This project is about making a big volume housing lots of specialist shops and public functions. The program is derived from the popular small shops in the surrounding area. The aim of this shopping mall is to give lots of voids and spaces back to the public, which fits the spirit of Amsterdam. In order to provide shoppers a different urban space experience in addition to the architectural interest of the building, the designer has planned three layers of voids. The interior design is divided into three vertical zones consisting of 1F, 2F, and 3F. The voids on the 3F floor are used as a transition space, creating a buffer zone between the two main atrium spaces. The atrium on the 1F floor is a public space designed for people to enjoy and relax. The atrium on the 2F floor serves as a public space for people to gather and socialize. Diverse height spaces for the bridge through the passage view from the cafe to the atrium
