In the 1960's, many university premises were built to meet the growing spatial needs of the growing number of students. This resulted in large and functional university areas, but with a rather anonymous and standard look. In this project, we tried to improve the campus facilities and to add public space in order to attract more people to the campus.

The project consists of a 75 meter tower that will become a new visible landmark at the edge of the inner city of Amsterdam. This new icon will contribute to the collection of important buildings that can be found on the Sarphati-straat.

Based on my research I created a strategy of enlivening the Roeterseiland campus by addressing the campus' problems, mainly resulting from planning mistakes in the 1960's. It states that this restructuring spatial design suggests a clear solution for widespread university faculty of law.

The tower structural system is connected to the existing campus surroundings. To the south, the tower structural system is connected to the existing campus surroundings. To the west, the tower structural system is connected to the existing campus surroundings. To the east, the tower structural system is connected to the existing campus surroundings. To the north, the tower structural system is connected to the existing campus surroundings.
