Board of examiners: Daan Vitner

A recycle trash factory will transform the plastic in the desert into a building material and will replace most of the scarce wood. Where wood is needed, Moroccan planted trees will be used.

The pattern of the roof is based on the traditional Moroccan roof, but scaled up and made of wood and recycled plastic beams instead of wood and reed.

The buildings will be made of a reinforced mud brick, which will be stronger and more resistant to rain thanks to the addition of lime stone and cactus juice and the Ballram press during the process.

Flexibel space on the first floor (develop / manage) > on image: women have build their own workspace

Hamam (meet / manage)

The design of the Digital Market can also be found on the repository, (search for: Maaike de Visser).
