Graduation Plan: Architecture

1. Personal information

Name: Sander Bakker
Student number: 4041771
E-mail address: sander.bakker@icloud.com

Studio

Chair: The Why Factory
Theme: The Vertical Village, Jakarta Impian (A dream for Jakarta)
Teachers: Professor Winy Maas, Ulf Hackauf, Adrien Ravon

Argumentation of choice of the studio

We started this project as a group with the goal of researching urban villages in South East Asia. The Why Factory started a research on this topic in 2007 with the Vertical Village studios, which lead to a publication in 2011. We planned on bringing the knowledge and research further by focusing on the city of Jakarta, Indonesia, and design a “real” vertical village.

Jakarta as a city was chosen because of the fact that 70% of the city consists of what is called kampungs, also known as urban villages. The city is in a desperate need of a new vision on this informal part of the city while maintaining the growth of its global and formal city, the kota.

2. Product

2.1 Problem statement

Jabodetabek, the urban agglomeration consisting of DKI Jakarta, Bogor, Depok, Tangerang and Bekasi, is the second fastest growing megacity on the planet (Robinson, 2011). Current projections show that Jabodetabek’s population will reach 38 million people in 2030 (Jakarta municipality, 2014). However, this growth will take place in a city that is facing major problems; all these issues are deeply interconnected and are seriously jeopardizing the city’s livability. (Kusno, 2010; Robinson, 2011; Silver, 2007). We believe these problems should be tackled with a radical reconsideration of Jakarta’s urban fabric. In doing so it the city would take decisive steps in its pursuit of becoming a world-class megacity.

In 2030 Jakarta will have expended so much, and in this process overtaken many adjacent cities, that it will be called Jabodetabakasepususesuci (Jakarta municipality, 2014). An unpronounceable name for a megacity that has become so addictive to growth that it will become uncontrollable. In general, an increasing amount of city will decrease the net capita per square km. The municipality will be left incapable in effectively managing the dramatically enlarged city.

The only way to pursue the ambition of a world-class city is to address all problems simultaneously. Since the real estate market stands in direct relation with the stock market (2) (Rolnik, 2013), the city has become addicted to urban growth. Therefore, a building stop would imply an economic stop. Urban sprawl is one of the main outcomes of the real estate investments. We believe stopping the urban sprawl (3) to be the first and most critical step in solving the city’s problems. The projected urban growth should take place within the center of DKI Jakarta.

Although official numbers forecast differently, we expect an even further decrease of the population
in the city center of DKI Jakarta due to the increase of the middle class. The middle-class, which will be doubled in 2020, will either move to the suburbs or enlarge their spatial demand per capita within the city center. To accommodate this spatial demand the low-income groups will be bought out of the existing kampungs. It will slowly turn them into gated middle class communities. As a result, the former Kampung dwellers will be forced to outskirts of the city, which in terms results in even more commuting and sprawl.

Stopping the urban sprawl will mean that the city center, known as DKI Jakarta, should increase its density; both in its inhabitants as well as its FAR (Floor Area Ratio), in order to be able to house the majority of the expected growth for all income classes. The current DKI Jakarta 2030 master plan is developed for a population of 10 million with a density of to 15.000 inhabitants / km2 and an economic growth of 6-7 %. We propose to double this by increasing the average density to 30.000 inhabitants / km2, this will amount to a total population of 20 million. This change will require a new kind of urban fabric, in which the kampung is intensified. The re-envisioned Kampungs will have to house more people then ever while maintaining its diverse income groups. This strategy will offer the opportunity to tackle some of Jakarta’s major issues. With this focused approach the city would benefit from a larger investment per square meter.

We believe Jakarta’s major problems could be eased with a radical reconsideration of Jakarta’s urban fabric. Solving these problems and maintaining the crucial relationship between the formal city (Kota) and the informal (Kampung) (Sihombing, 2004, 2010) would ensure Jakarta’s prospect of becoming a world-class city. What if we could stop this relentless expansion of the city, which will only harm the city more, but still allow the growth (from mitigation) to happen within the city center? And doing this in such a way that we can bring kota and kampung back in balance.

2.2 Main research question

How can a densified Jakarta maintain and at the same time upgrade the culture of its Kampungs?

2.3 Design Assignment (individual)

Jakarta is facing some major issues in the decades to come. To cope with these problems we have stated that by densifying the city centre we can offer possible solutions. Considering the idea that densification does not necessarily mean higher cities, but rather better organized cities, infrastructure is an important factor for densifying Jakarta.

In the new master plan for Kebon Kacang we will revise the current infrastructure and add where is needed. The current flow of people to the Tanah Abang area represents two types of consumers. The one that operates on a city scale and the one that operates on a local scale. A kampung does not specialise itself, it reacts to larger economic factors that surround it. The Pasar Tanah Abang Blok A is one of those economic factors in Kebon Kacang. Although the building itself is an introverted entity, this large textile market provides the possibility for a wide range of smaller economic activities.

The main question is thus: what if we could densify and intensify activities around the present infrastructure, which is relatively well connected to or imbedded in its direct surrounds. The current infrastructure would provide the organization that is needed to densify several typologies, such as housing and commercial typologies.
2.4 Goal

On the city scale (group)

The current DKI Jakarta 2030 master plan is developed for a population of 10 million with a density of to 15,000 inhabitants / km2 and an economic growth of 6-7 %.

We propose to double this by increasing the average density to 30,000 inhabitants / km2, this will amount to a total population of 20 million.

This change will require a new kind of urban fabric, in which the kampung is intensified. The re-envisioned Kampungs will have to house more people then ever while maintaining its diverse income groups. This strategy will offer the opportunity to tackle some of Jakarta’s major issues

On the small scale / a building (individual)

Infrastructure plays a crucial part in the strong physical and economic typologies surrounding the Kebon Kacang area. I will reimagine the role of infrastructure and its importance to the commercial and housing typologies in Kebon Kecang, when density is doubled.

3. Process

3.1 Method description

The studio is set up as a research by design studio. We subtract parametric data from existing situations (kampungs) and reuse and reinterpret this data in our projects.

In the next phase we will design structures for four different situations that can be found everywhere in the city.

3.2 Literature and general practical preference

To be able to address the large amount of information we have formed a group of four students. Up until now we have researched the many urgencies of the city based on official data from the Jakartan and Indonesian government, previous data by The Why Factory, reports by the World Bank and UN and through connections with local architects, thinkers and research groups in Jakarta. We spend one month in Jakarta in order to gain a better understanding of and documenting the issues at hand. During this visit we researched several areas and we spoke to numerous relevant parties. Measurements of kampung elements will be used as for parametric research purposes.
Overview of the main literature:

Sihombing, A. (2004). *The transformation of Kampungkota; symbiosys between kampung and kota, a case study from Jakarta.* *Department of Architecture, University of Indonesia.*

4. Reflection

4.1 Relevance * See 2.1

Jabodetabek, the urban agglomeration consisting of DKI Jakarta, Bogor, Depok, Tangerang and Bekasi, is the second fastest growing megacity on the planet (Robinson, 2011). Current projections show that Jabodetabek’s population will reach 38 million people in 2030 (Jakarta municipality, 2014). However, this growth will take place in a city that is facing major problems; all these issues are deeply interconnected and are seriously jeopardizing the city’s livability. (Kusno, 2010; Robinson, 2011; Silver, 2007). We believe these problems should be tackled with a radical reconsideration of Jakarta’s urban fabric. In doing so it the city would take decisive steps in its pursuit of becoming a world-class megacity.
4.2 Time planning

*This planning is based on the aim of graduating in December 2014*

**February, March, May:**
Understanding of the city, the kampung and preliminary design
orientation to assignment, literature study, topic research, test phase design proposals, design
methodology research, correspondance relevant parties, preparation field study, precedent-
research, research book

**May:**
Visit of Jakarta, grip on atmosphere, understanding of situation, understanding (im)possibilities
field studies, visiting relevant parties (interviews/data exchange), re-orientation to assignment,
definition of project

**June, July:**
Re-adjustments of design proposal based on field-trip findings
re-orientation to assignment, definition of project, presentation of research and design methodology

**August-October:**
Following defined research and design methodology, working out design proposals
drawing process, re-adjustment of proposal to all relevant scales (s,m,l,xl) of jakarta

**November-December:**
Finalizing design proposals
drawing process, re-adjustment of proposal to all relevant scales (s,m,l,xl) of jakarta
