The main intention of this project is the proposal of a new spatiality of the landscape that makes us think about the air in a different way. The complex and historic urban landscapes form a base that helps to integrate new designs. The result is a future landscape that will harmonize with the natural environment, creating a new level of sustainability. This new spatiality is based on the following elements:

1. **Pedestrian & Bicycle Path Network**
   - Enhances connectivity and accessibility across the area.
   - Promotes healthy and sustainable modes of transportation.

2. **Waterways**
   - Connects different parts of the city, promoting biodiversity and recreation.
   - Provides flood protection and aesthetically enhances the landscape.

3. **Historic Centers**
   - Preserves and celebrates cultural heritage.
   - Acts as nodal points for tourism and community events.

4. **Green Structures**
   - Enhances air quality and provides habitats for wildlife.
   - Offers recreational spaces for residents and visitors alike.

A comprehensive infrastructure of these elements will create a sustainable, resilient, and dynamic urban environment. The project seeks to transform the area into a green oasis, promoting social cohesion and environmental sustainability.
