## Minimum chlorine concentration to ensure disinfection

Chlorine inactivation of the mixed population versus indicator microorganism

#### Introduction Chlorine experiment

#### Minimum free chlorine concentration based on:

- Mixed microbial population
- Indicator microorganism

Applied Science

Environmental biotechnology

m.c.f.m.peters@tudelft.nl

### Methods

Civil Engineering

Water management

Applied Science

Environmental biotechnology

Marjolein Peters

m.c.f.m.peters@tudelft.nl

#### Methods Chlorine experiment

#### Non-chlorinated swimming pool water

- Shower water 1st minute
- Different chlorine concentrations
- Live/dead interpretation of cells

#### Same experiments with indicator organism

- Shower water + *E.coli*
- Viability of cells

#### Results

Civil Engineering

Water management

Applied Science

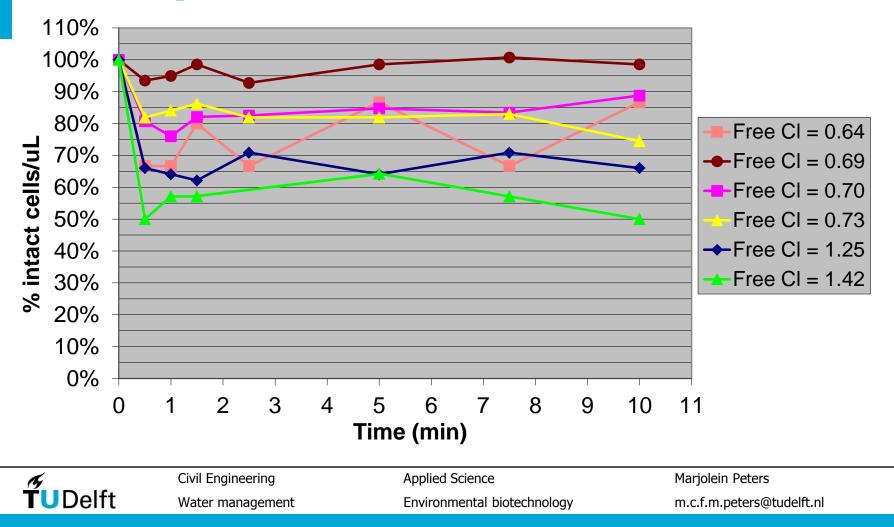

Environmental biotechnology

Marjolein Peters

m.c.f.m.peters@tudelft.nl

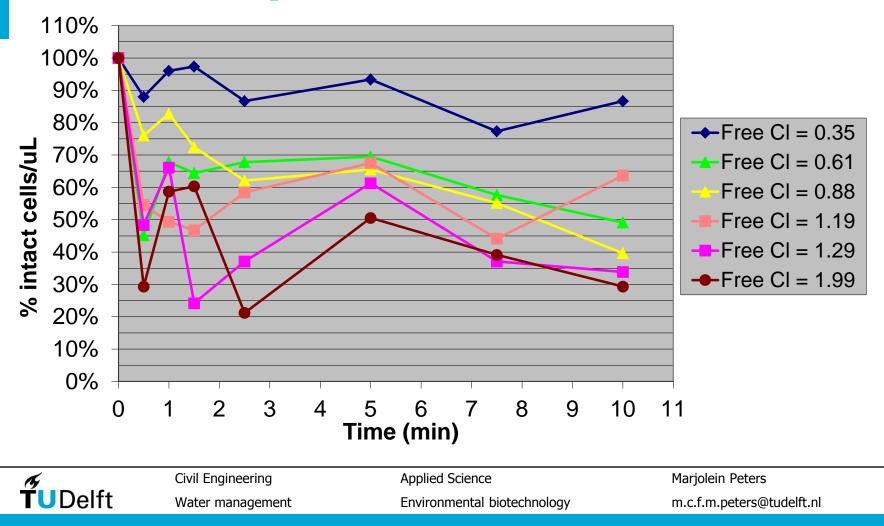

# Results

Percentage of intact cells in shower water after exposure of chlorine

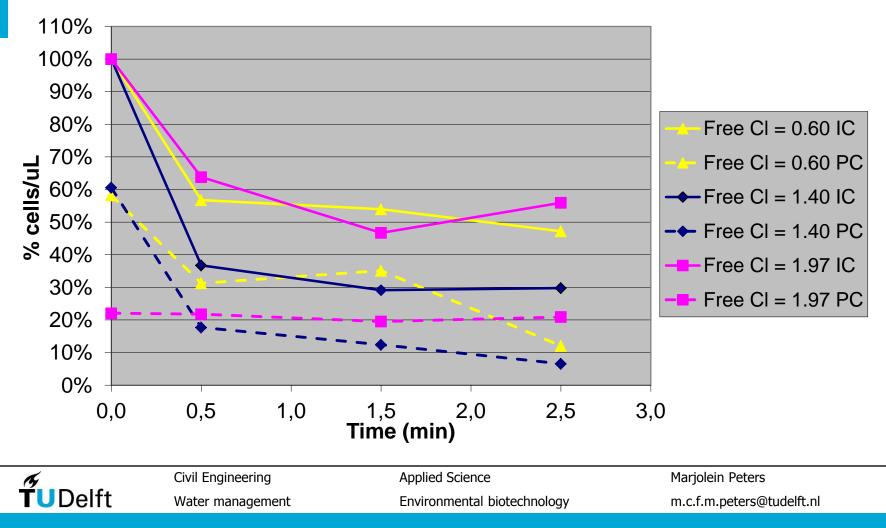

# Results

Percentage of intact *E.coli* cells in shower water after exposure to chlorine

## Results

Percentage of intact *E.coli* cells (IC) and viable *E.coli* cells (PC) in shower water after exposure to chlorine

### Conclusion

Civil Engineering

Water management

Applied Science

Environmental biotechnology

Marjolein Peters

m.c.f.m.peters@tudelft.nl

# Conclusion

- Intact cell decay depends on free available chlorine concentration
- *E.coli* cells more sensitive to chlorine than mixed population
  - Still no 4-log removal in 30 seconds
- Decay of intact cell show similar graph to viability decay

Applied Science

Environmental biotechnology

### Future work

Civil Engineering

Water management

Applied Science

Environmental biotechnology

Marjolein Peters

m.c.f.m.peters@tudelft.nl

### Future work

Viability tests

- Shower water
- Microscopy
  - Biofilm protection?
- Pyrosequencing
  - Which organisms survive chlorine?

Applied Science

Environmental biotechnology
