What are the new values exchanged?

The design proposes a transformation of the format of a long-term commitment into a new culture promoting short-term engagement. Moreover, the remote and disconnected communities targeted through the statement will be incentivated to step away from their isolated condition in order to join the network promoting short-term engagement. Moreover, the remote and disconnected communities targeted through the statement will be incentivised to step away from their isolated condition in order to join the network promoting short-term engagement.

The design aims to provide a set of countries. Germany, Norway, Italy, France, and Estonia are depicted. The design proposes a transformation of the format of a long-term commitment into a new culture promoting short-term engagement. Moreover, the remote and disconnected communities targeted through the statement will be incentivised to step away from their isolated condition in order to join the network promoting short-term engagement.

Mobility is becoming a crucial factor to define contemporary social life. It has changed the relationship between government and economy, public and private, work and life, shaping a world that promotes unstandardised movements of people, products, consumption and working subjects. The fundamental redefinition of established social, political and economic structures and relationships has led to emerging mobile practices, relations and on the language of mobility that strongly influences modernity.

In recent studies, researchers are exploring the increasingly closer connection between specific forms of mobility and distribution of the chances. Mobility is becoming strictly linked to issues of social inequality, rights and democracy, and therefore intrinsically political. Governments are looking at mobility as a chance for economic growth, social inclusion and development.

With an explorative approach, this project proposes an innovative framework to be used as a tool to understand and upgrade the future expressions of Social Mobility in the context of Europe 2030. The model proposed aims to help designers, policy makers and public administrations, students and creative solutions for the future, inclusive to the new cultures emerging and defining today. The model takes is disclosed through the service "GLEU: the Glocal European Mobility Network" developed with the use of the model.
As a designer wanting to bring innovation within the context of social mobility, you can use the model as the foundation for your design. 3 driving forces influence the future of social mobility giving expressions to different behaviours. Your selection of the 3 expressions results in the description of a future practice. The future practice describes the behaviour that is intended to correct, encourage or support with your design. From the future practice, you will develop a mission statement to clearly express how you intend to change the future of social mobility.

Double-Edged Mobility

Citizens are developing transnational identities. This will result in citizens that identify more and more with their cities, rather than with their countries, citizens that go per se *glocal*. Increasingly more mobile citizens will develop an attachment to different locations in Europe but nationalities and national policies will prevent them from actually feeling part of the social structure of such places. Their unique journeys and identities will not feel represented and this will cause distress in the perception of their own mobility.
