AH Graduation Summary: Heizplat Scienecenter

The environmental conditions of urban and rural areas, Fundation and the demand on sustainability are an increasingly important issue for our society. The climate is deteriorating and urban areas are becoming more crowded, while the edges of cities are losing their identity. This has lead to a re-evaluation of the city form and the way we design and build. In this project, we focus on the concept of a modular and flexible building system. The concept is based on a modular design that can be adapted to different sites and climates. The building is designed to be energy-efficient and sustainable. It is a modular system that can be easily adapted to different sites and climates. The building is designed to be energy-efficient and sustainable. It is a modular system that can be easily adapted to different sites and climates.

The building is designed to be energy-efficient and sustainable. It is a modular system that can be easily adapted to different sites and climates. The building is designed to be energy-efficient and sustainable. It is a modular system that can be easily adapted to different sites and climates.
